01.00	1 <sup>st</sup> Draft	2022/04/15

## 1. Product Introduction

BIGTREETECH SKR 3 EZ V1.0 motherboard is a 32-bit 3D printer motherboard updated by the team of Shenzhen Biqu Technology Co., Ltd. for our EZ series drivers on the basis of SKR 3. It is compatible with both the EZ series driver and the series of TMC drivers.

### 1.1 Product Features

1. Using 32-bit ARM Cortex-M7 series STM32H743VI main control chip with a main frequency of 480MHz, the performance has greatly improved.
2. The power chip adopts TPS5450-5A, which supports DC12/24V power input. The output current of the chip is up to 5A, and the peak value can reach 6A, which perfectly supports the power supply of Raspberry Pi.
3. The motherboard reserves the BOOT button, users can update the motherboard boot program through DFU.
4. Increase the protection circuit of the thermistor part to avoid the burning of the main control chip due to leakage of the heated bed or heating rod.
5. The numerical control fan realizes 24V, 12V, 5V voltage selection through the external power supply module, eliminating the need for the operation of the customer's external transformer module, thereby reducing the probability of damage to the motherboard.
6. The thermistor can select the pull-up resistance value through the jumper, and support PT1000 in this way without the need for external modules, which is convenient for customers to use DIY.
7. Support all versions of our company's serial screen, SPI screen and LCD screen.
8. Upgrade the configuration firmware through an SD card, the operation is simple, convenient and efficient.
9. On-board DIAG function pins can be used by simply plugging and unplugging the jumper cap.
10. Supports functions such as resume printing, Filament Runout Detection, Completed Shutdown, BLTouch, RGB Lights, etc.
11. High-performance MOSFETs are used to reduce heat generation.
12. Adopt a replaceable fuse for easy replacement.
13. WIFI module (ESP-12S, ESP-07, ESP32) general interface.

14. The on-board non-self-elastic Micro SD card slot, and is SDIO working mode, which greatly speeds up the transfer rate.
15. Onboard EEPROM, which is convenient for users to save parameter information.
16. Two types of CAN interfaces are reserved, USB port and XH2.54 6Pin terminal interface. The USB port is used to select CAN and USB through the double-pole double-throw switch, which is convenient for customers to use other accessories of the CAN interface.
17. The temperature sensor interface adopts a high-precision pull-up resistor.
18. Two types of drive sockets are used, which are compatible with our EZ series drive modules and TMC series drive modules.
19. Each motor drive module can select the corresponding motor voltage through the jumper cap.
20. The motor power supply supports up to 48V, and for the larger voltage when using TMC5160 and EZ5160, an isolation chip is used to protect the mainboard from burning IO.

## **1.2 Product Parameters**

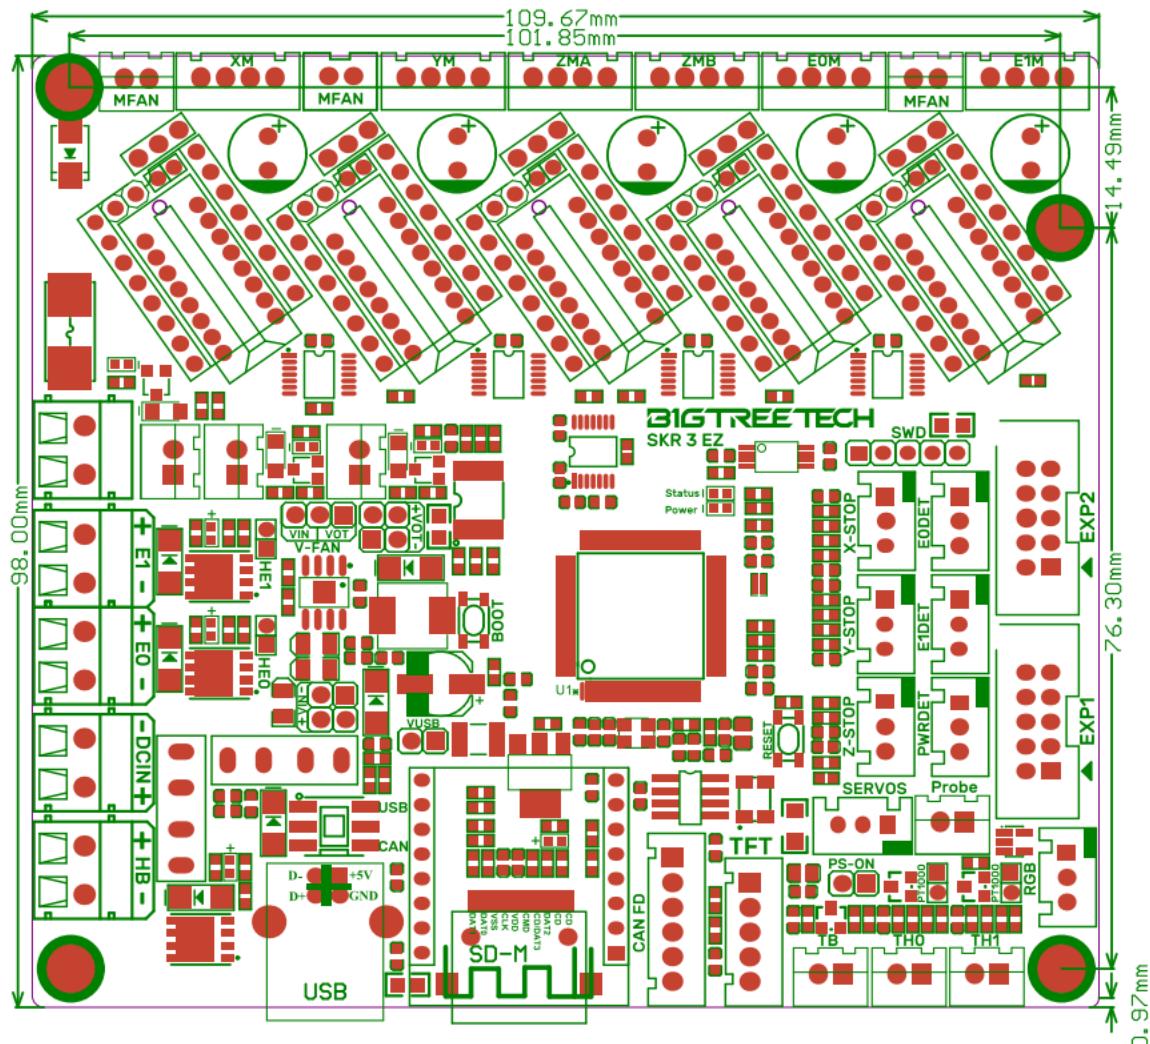

1. Product Size: 109.7 x 98mm, for details, please refer to **BIGTREETECH SKR 3 EZ V1.0-SIZE.pdf**
2. Installation Size: 102 x 76mm
3. Microprocessor: ARM Cortex-M7 STM32H743VI
4. EEPROM: 24C32 32Kbit
5. Input Voltage: DC12V-DC24V
6. Motor Voltage: DC12V-DC48V
7. Logic Voltage: DC 3.3V
8. Heating Interface: Heated bed (HB), Heating Rod (E0, E1)
9. Maximum Output Current of Heated Bed Port: 10A, Peak Current 11A
10. Maximum Output Current of Heating Rod Port: 5.5A, Peak Current 6A
11. Fan Interface: Three CNC fans, three normally open fans, the voltage of the CNC fans is optional.
12. Maximum Output Current of Fan Interface: 1A, Peak Current 1.5A

13. The Total Current of Heating Rod + Driver + Fan: less than 10A
14. WIFI Interface: ESP-12S, ESP-07S, ESP32
15. Expansion Interface: BLTouch (Servos, Probe), PS-ON, PWR-DET, Fil-DET, RGB, CAN FD
16. Motor Drive: Support EZ5160, EZ2209, EZ2208, EZ2225, EZ2226, EZ2130, EZ6609, TMC5160, TMC2209, TMC2225, TMC2226, TMC2208, TMC2130, etc.
17. Driver Working Mode Support: SPI, UART, STEP/DIR
18. Motor Drive Interface: X, Y, Z (dual Z-axis), E0, E1 Five Channels
19. Temperature Sensor Interface: 1 100K NTC, 2 100K NTC and PT1000 optional
20. Display: Serial Touch Screen, SPI Touch Screen, LCD
21. PC Communication Interface: Square USB A, easy to plug and unplug.
22. Supported File Format: G-code
23. Support Machine Structure: Cartesian, Delta, Kossel, Ultimaker, CoreXY
24. Recommended software: Cura, Simplify3D, Pronterface, Repetier-host, Makerware.

### **1.3 Firmware Support**

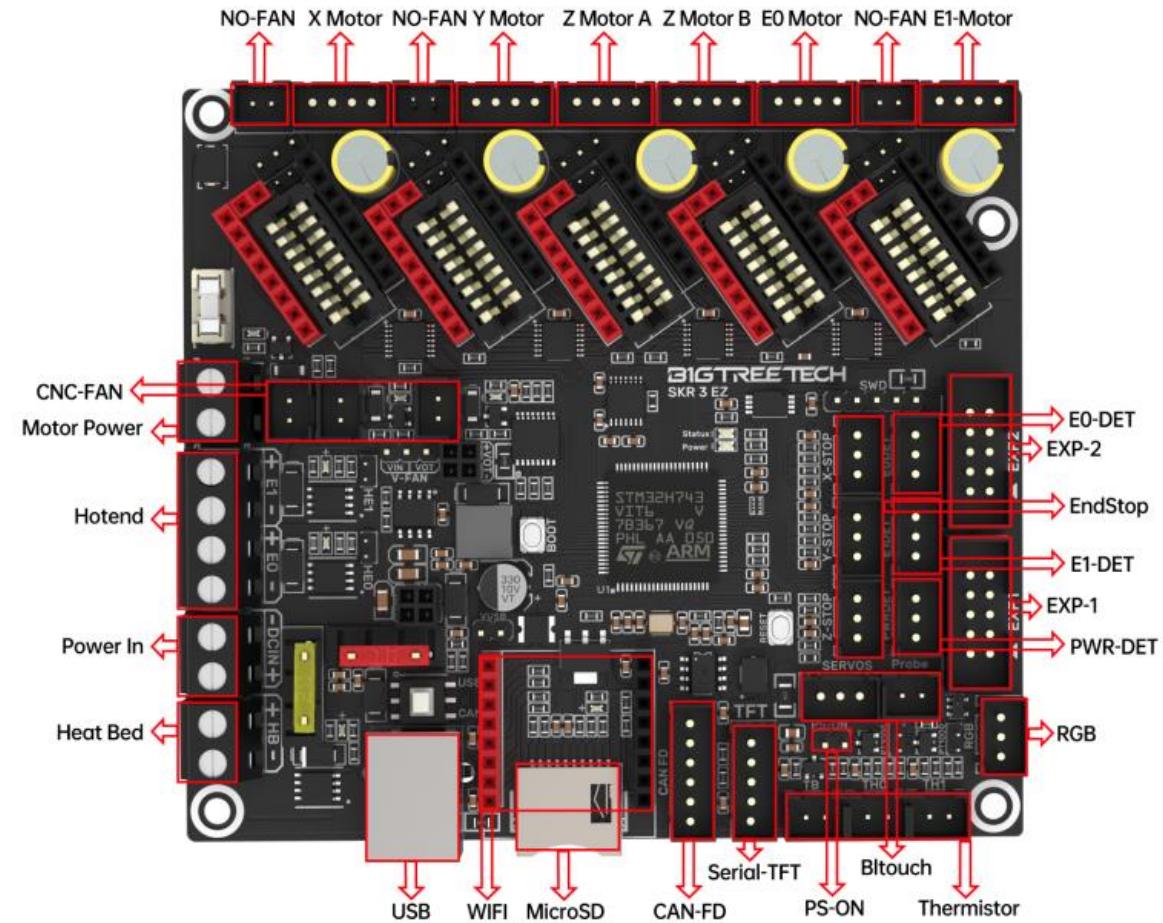

The product currently only supports Marlin and Klipper firmware, and does not support RRF (RepRapFirmware).

## 1.4 Product Size

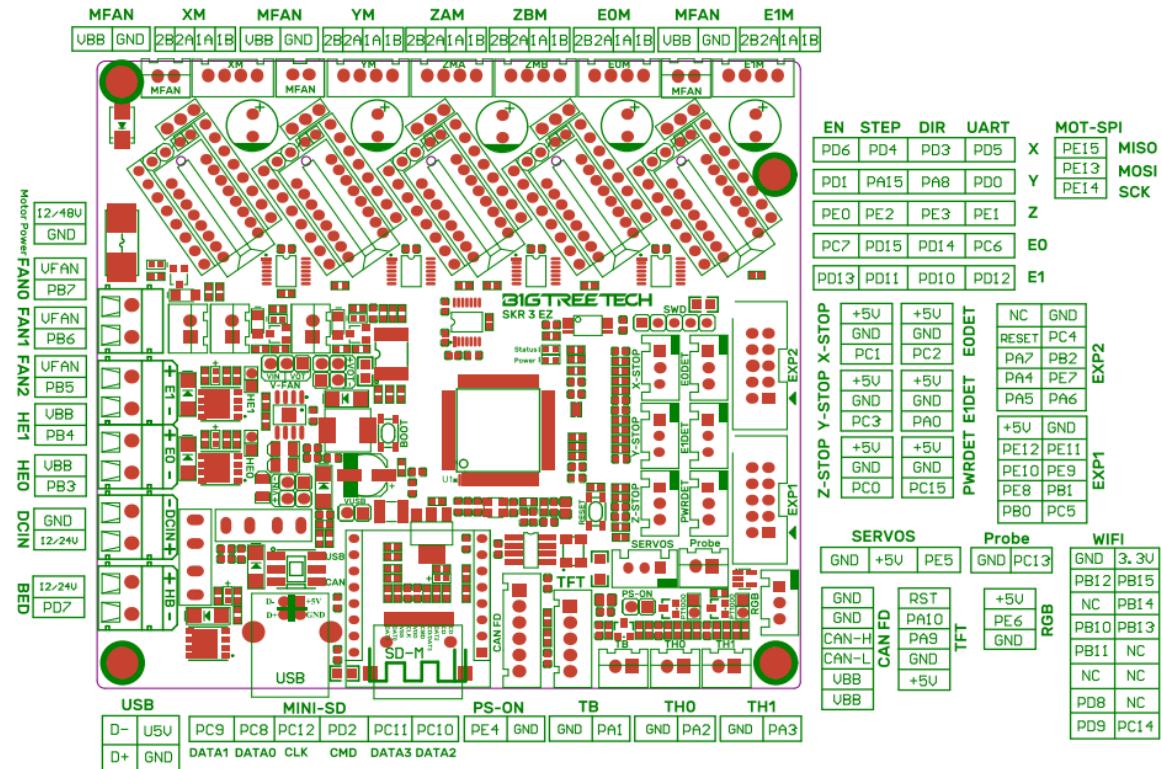

## 2. Peripheral Interface

### 2.1 Interface Diagram

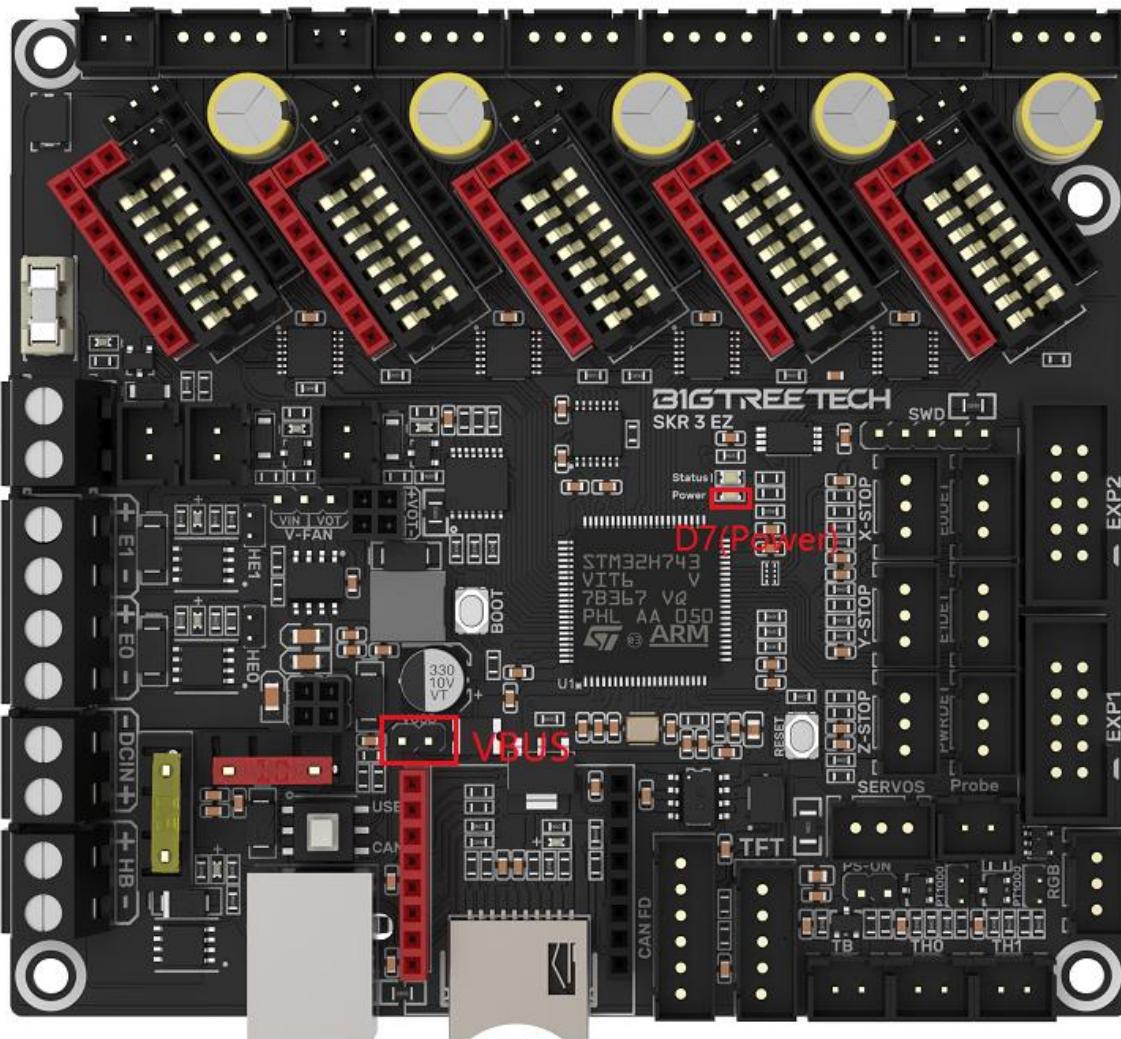

## 2.2 Pins Description

### 3. Interface Introduction

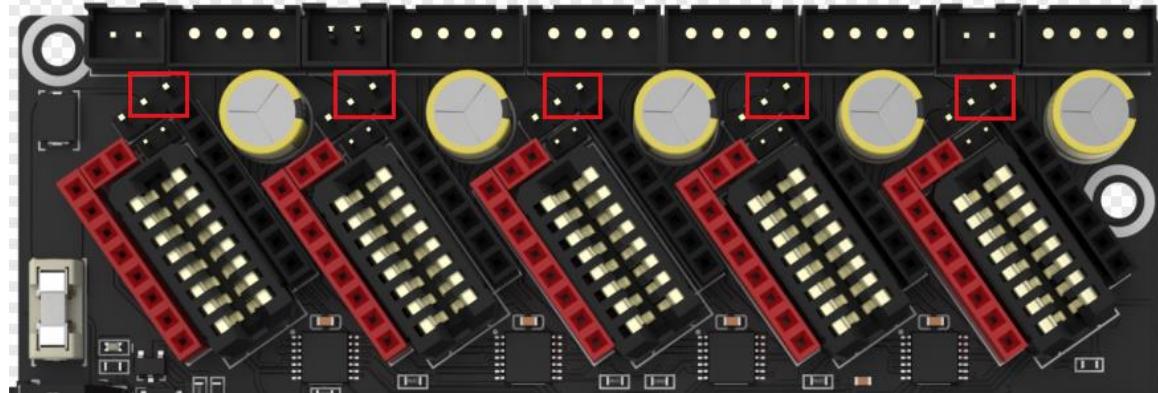

#### 3.1 USB Powered

After the SKR 3 EZ V1.0 motherboard is powered on, the red light of D7 (Power) in the upper right corner of the MCU will light up, indicating that the power supply is normal. The VUSB in the middle of the board is the power selection terminal. Only when using USB to supply power to the motherboard or need to supply power through USB, you need to use the jumper to make the VUSB short circuit.

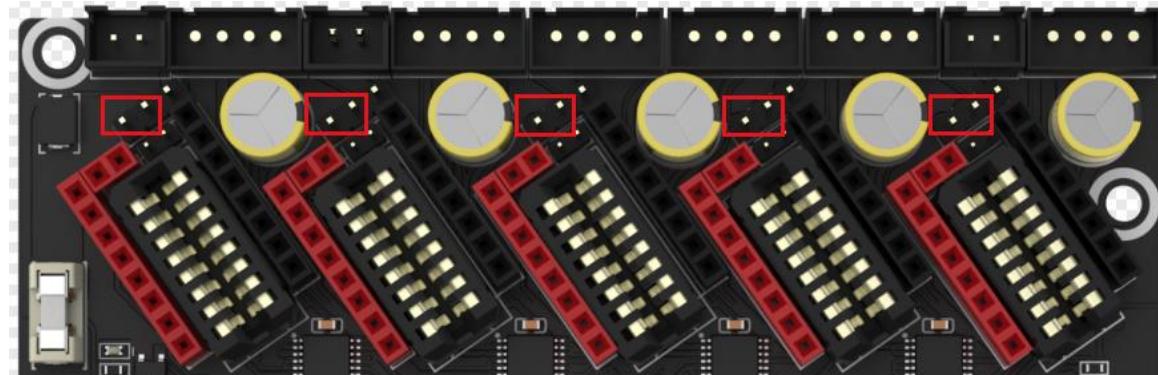

## 3.2 Motor Voltage Selection

### 3.2.1 Motherboard Power Voltage for Motor Voltage Selection

### 3.2.2 Motor Supply Voltage for Motor Voltage Selection

## 3.3 Step Motor Drivers

### 3.3.1 TMC-driven Mode

The number of subdivisions needs to be set high or low by firmware to the corresponding subdivision configuration pins.

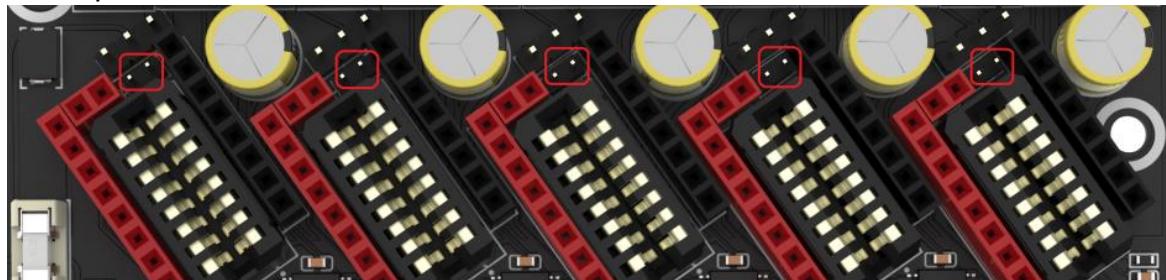

### 3.3.2 TMC/EZ-driven UART/SPI Mode

TMC series drivers do not support the use of both UART and SPI drivers at the same time, for example: X, Y-axis use TMC/EZ2209 (UART), Z, E0 axis use TMC/EZ5160 (SPI).

The EZ series drivers support the simultaneous use of both UART and SPI drivers.

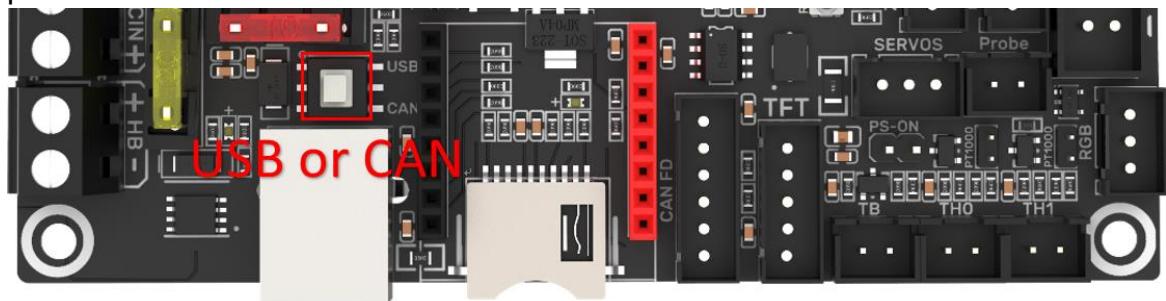

### 3.3.3 TMC-driven DIAG mode(Sensorless Homing)

As shown in the pictures, plug the jumper cap when using the Sensorless Homing function, and leave it unplugged when not in use. There is no need to cut the DIAG pin of the driver.

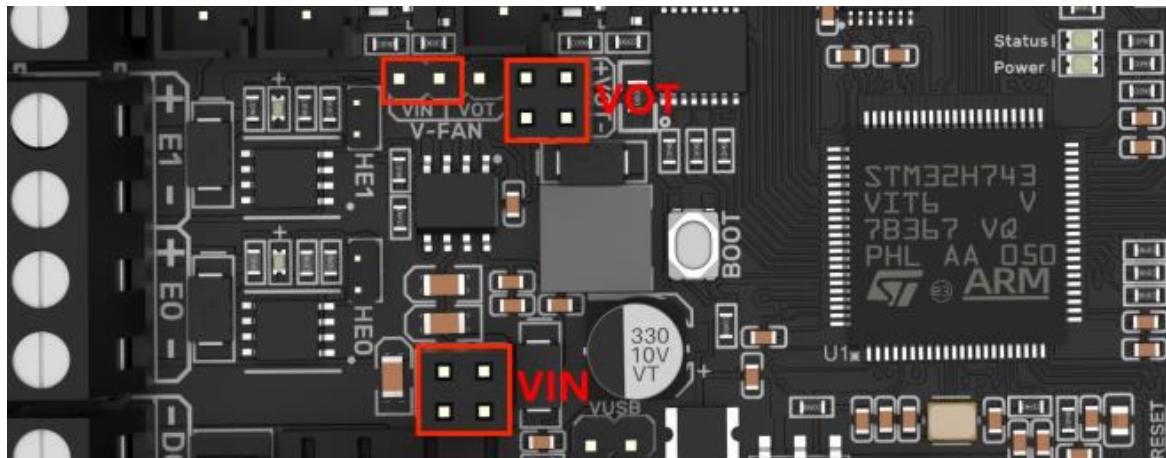

### 3.4 USB and CAN Mode

As shown in the figure below, the double-pole double-throw switch is in USB mode when it is in the pop-up state, and in CAN FD mode when it is in the pressed state.

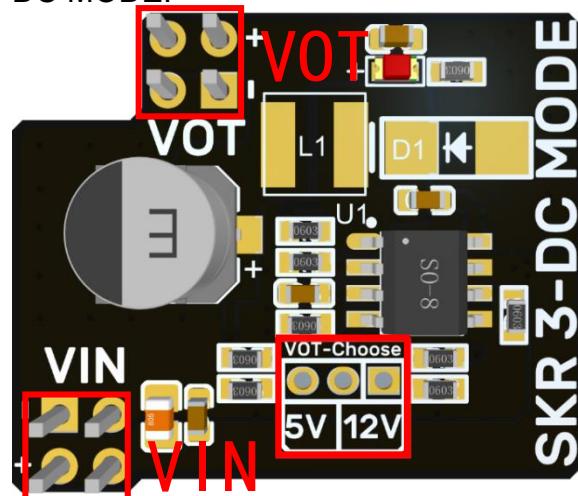

### 3.5 Voltage selection for NC fans

If DCIN is used as the power supply of the numerical control fan, a jumper cap should be used to short-circuit the two pins within the VIN range. If you want to use 12V or 5V as the NC fan power supply, you need to make a jumper cap short-circuit two pins within the VOT range, and insert the SKR 3-DC MODE into the 2\*4Pin VOT and VIN headers.

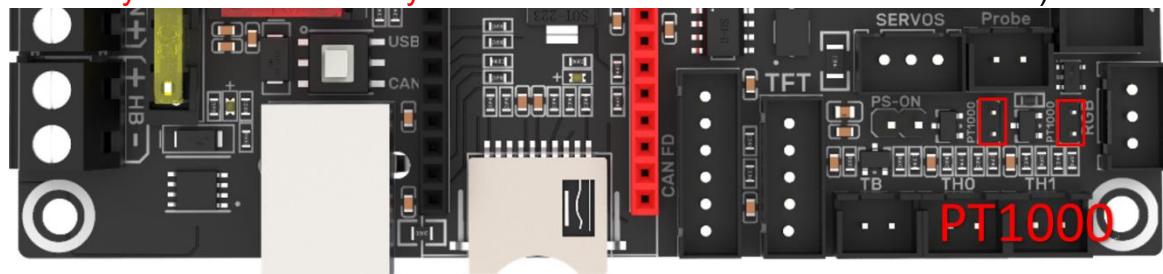

Set the VOT output voltage to 5V or 12V by setting the jumper cap on the SKR 3-DC MODE.

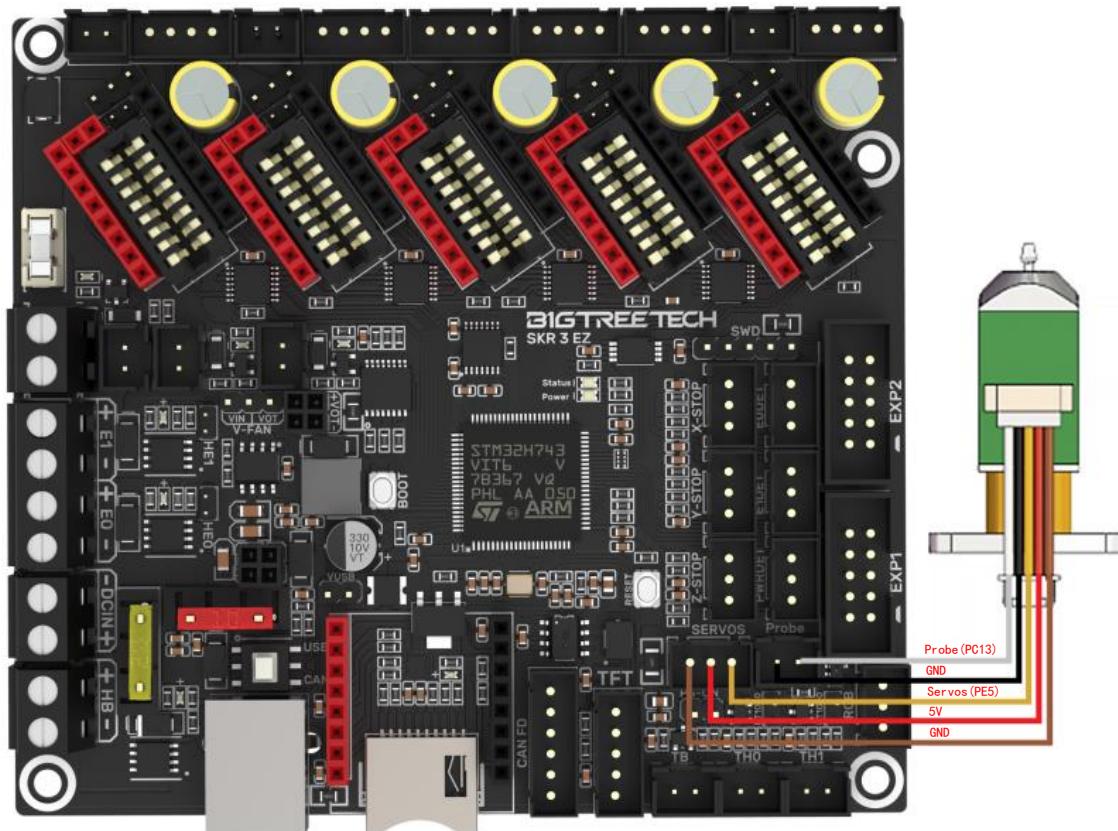

### 3.6 100K NTC or PT1000 Setup

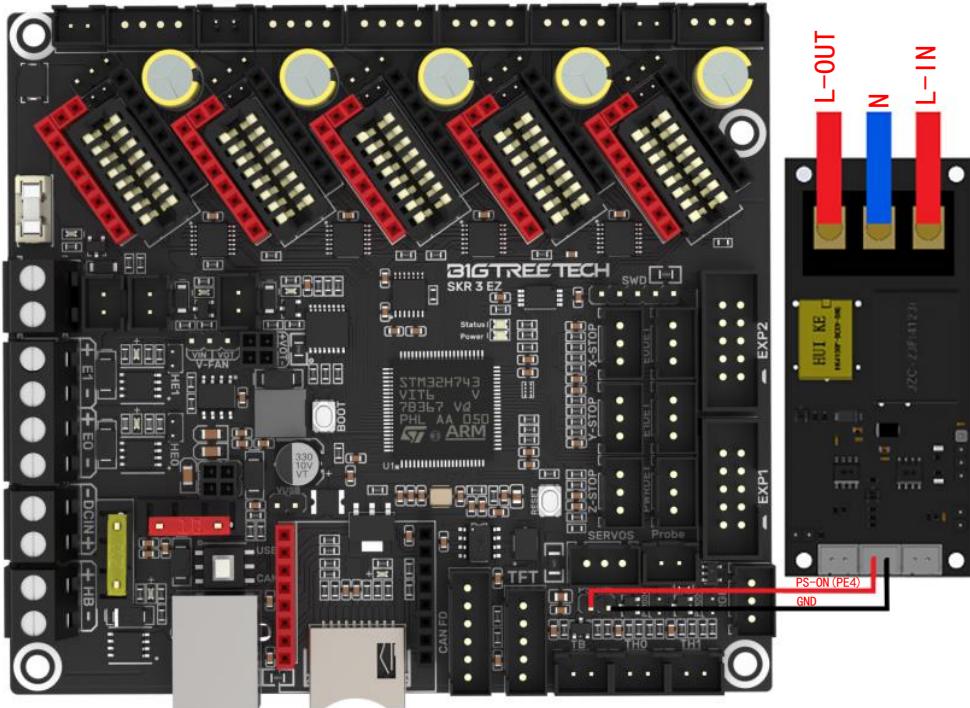

When using a 100K NTC thermistor, no need to insert a jumper cap. At this time, the pull-up resistors of TH0 and TH1 are 4.7K. When using PT1000, you need to use jump caps to short-circuit the two pins in the red box in the picture below. At this time, the pull-up resistors of TH0 and TH1 are 2.2K (**Note: the temperature accuracy read out in this way will be much worse than that of MAX31865**).

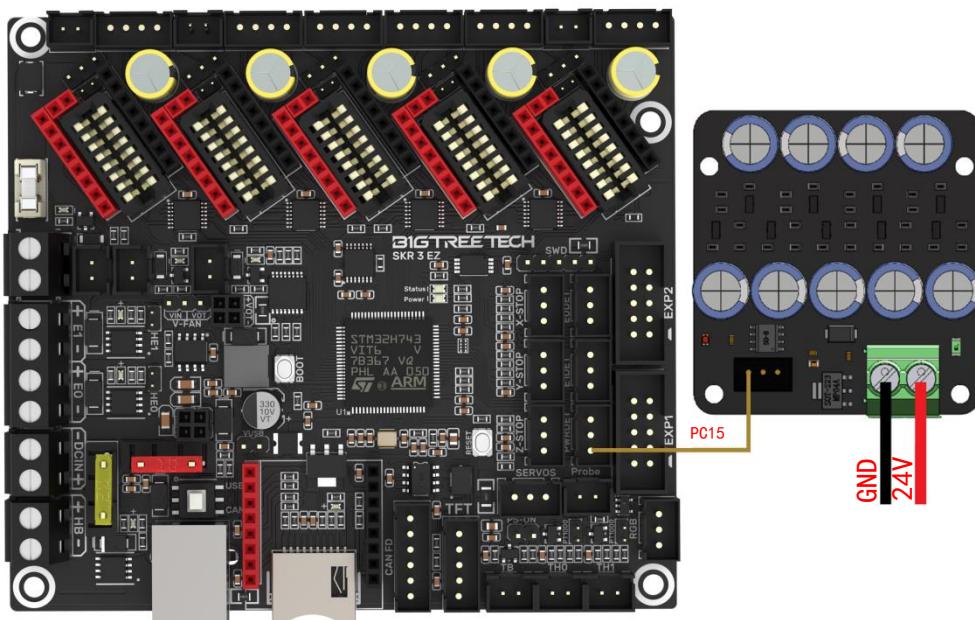

### 3.7 BLTouch Connection

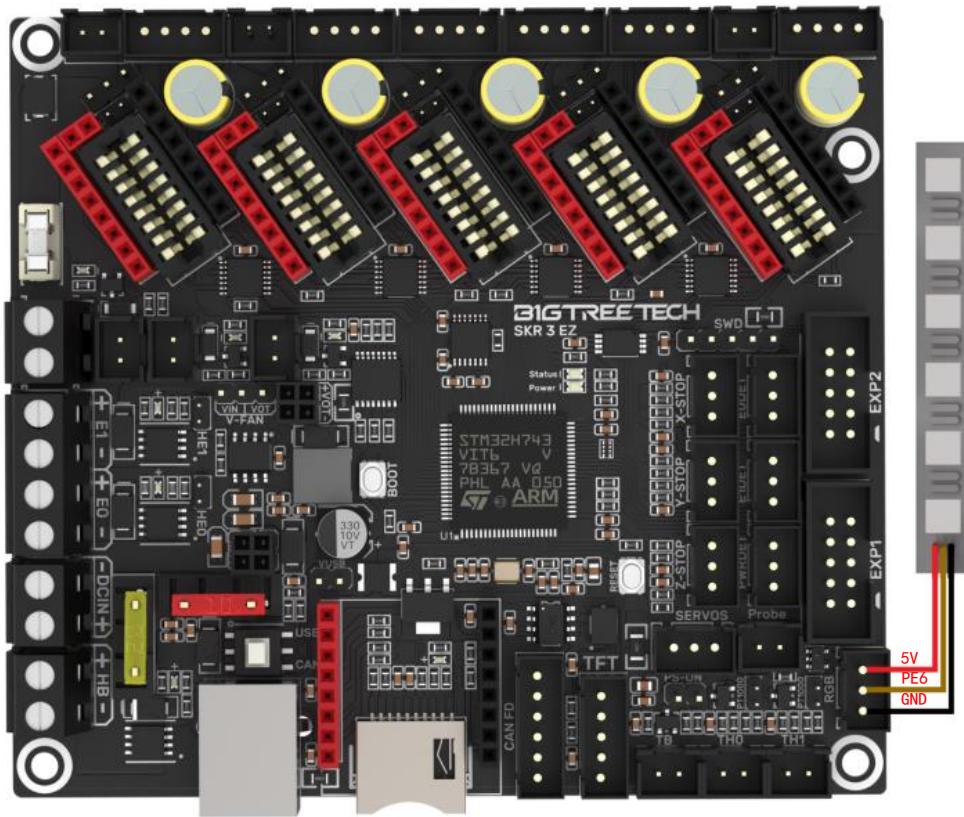

### 3.8 Completed Shut-down Module(Relay V1.2) Connection

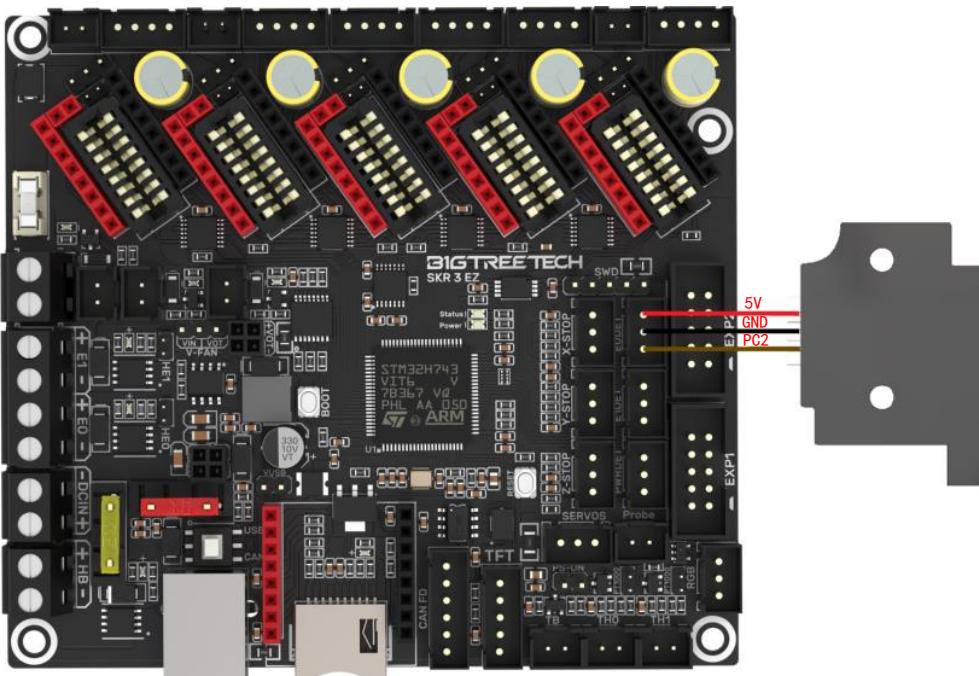

### 3.9 Resume Printing(UPS 24V V1.0) Connection

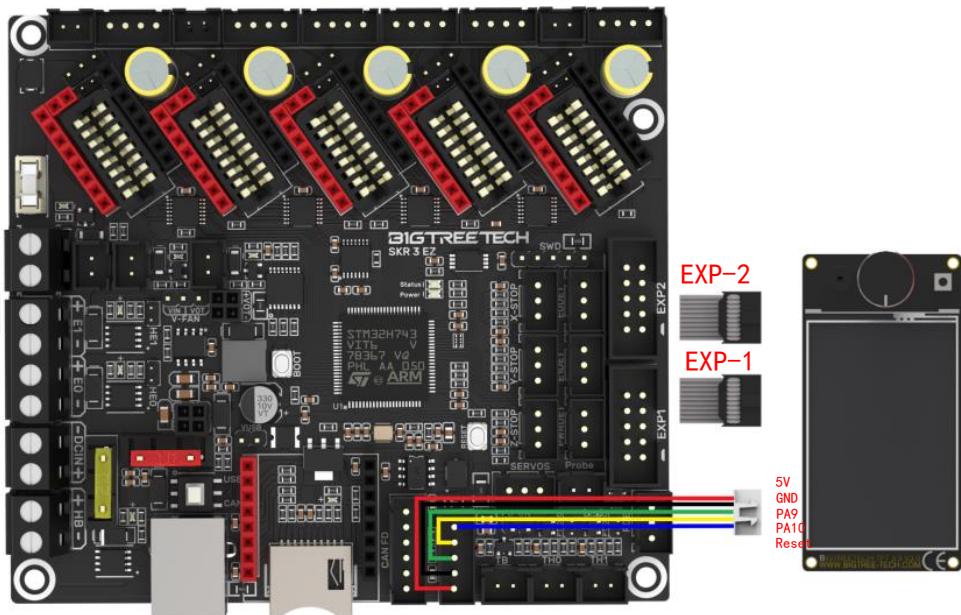

### 3.10 RGB Connection

### 3.11 Break Detection Connection

### 3.12 Touch Screen Connection

## 4. Marlin

### 4.1 Compiler Environment Installation

<https://github.com/bigtreetech/Document/blob/master/How%20to%20install%20VSCode%2BPlatformio.md>

[https://marlinfw.org/docs/basics/install\\_platformio\\_vscode.html](https://marlinfw.org/docs/basics/install_platformio_vscode.html)

Refer to the instructions in these two links to install VSCode and PlatformIO plugins (domestic users may be slow to install PlatformIO plugins online).

### 4.2 Download of Marlin Firmware

1. Download the latest version of the bugfix firmware from the Marlin official website:  
<https://github.com/MarlinFirmware/Marlin/tree/bugfix-2.0.x>
2. Download pre-configured firmware of Compiler Environment and board type from our GitHub:  
<https://github.com/bigtreetech/SKR-3>

### 4.3 Firmware Configuration

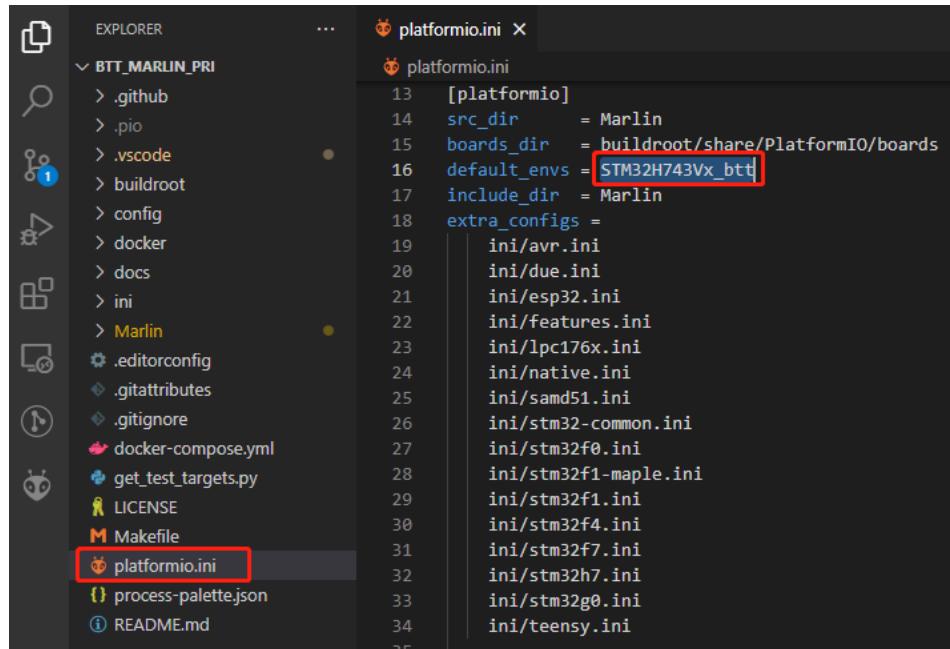

#### 4.3.1 Open the Marlin Project

You can open Marlin in VSCode in one of the following ways:

- Drag the downloaded Marlin Firmware folder onto the VSCode application icon.
- Use the **Open...** command from the VSCode **File** menu.
- Open the PIO Home tab and click the "**Open Project**" button.

## 4.3.2 Compiler Environment Configuration

Open `platformio.ini` file and modify `default_envs` to `STM32H743Vx_btt`.

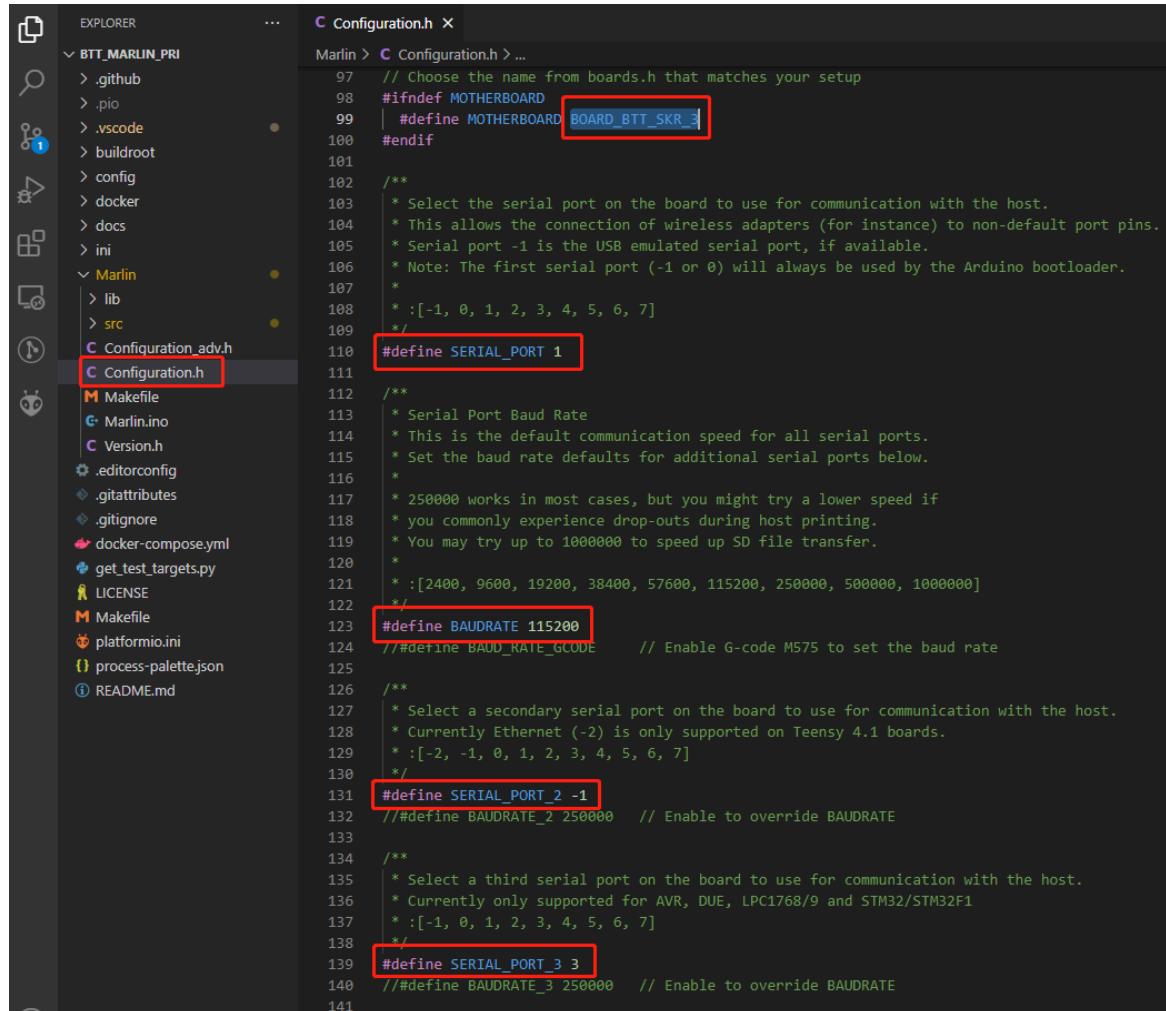

## 4.3.3 Motherboard type and Serial port number Configuration

Set Motherboard type `MOTHERBOARD` to `BOARD_BTT_SKR_3`

```
#define MOTHERBOARD BOARD_BTT_SKR_3
#define SERIAL_PORT 1      (Enable TFT serial port)
#define BAUDRATE 115200    (Set the baud rate, pay attention to the same as
the communication device)
#define SERIAL_PORT_2 -1   (Enable USB emulated serial port)
#define SERIAL_PORT_3 3     (Enable WIFI serial port)
```

The above settings can be enabled according to the needs.

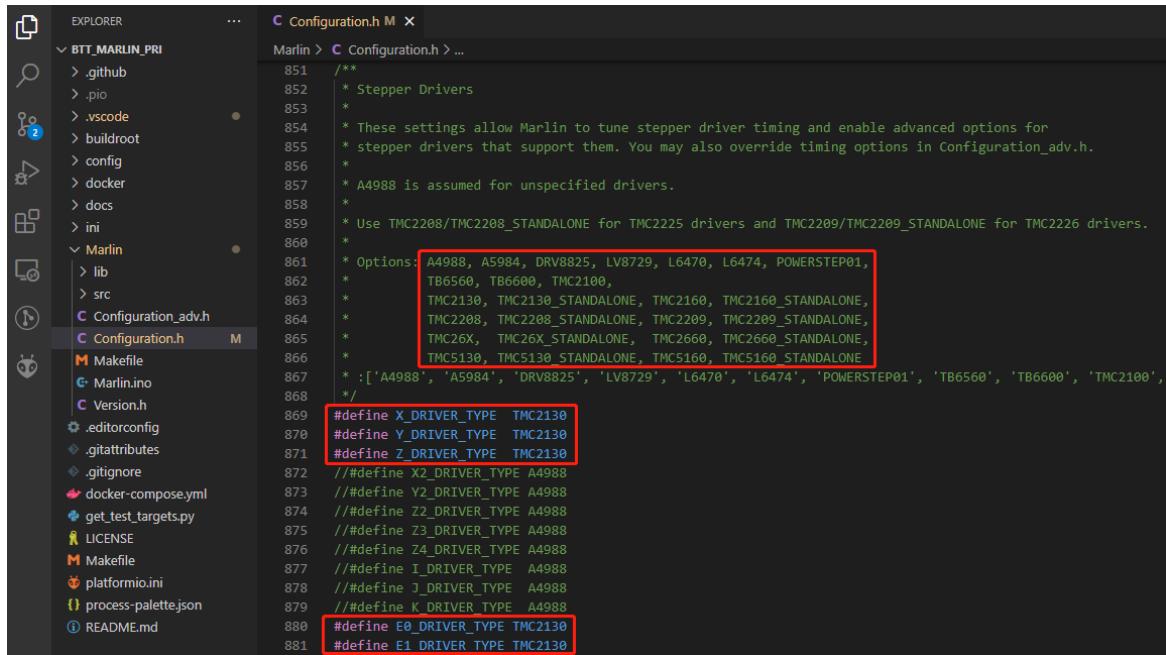

The screenshot shows a code editor interface with the following details:

- EXPLORER** sidebar:
  - Project: BTT\_MARLIN\_PRI
  - Files listed include: .github, .pio, .vscode, buildroot, config, docker, docs, ini, Marlin (lib, src), Configuration\_adv.h, Configuration.h (highlighted with a red box), Makefile, Marlin.ino, Version.h, .editorconfig, .gitattributes, .gitignore, docker-compose.yml, get\_test\_targets.py, LICENSE, Makefile, platformio.ini, process-palettejson, README.md.
- Code Editor**: The file **Configuration.h** is open.

```
Marlin > C Configuration.h > ...
97 // Choose the name from boards.h that matches your setup
98 #ifndef MOTHERBOARD
99 | #define MOTHERBOARD BOARD_BTT_SKR_3
100#endif
101
102 /**
103 * Select the serial port on the board to use for communication with the host.
104 * This allows the connection of wireless adapters (for instance) to non-default port pins.
105 * Serial port -1 is the USB emulated serial port, if available.
106 * Note: The first serial port (-1 or 0) will always be used by the Arduino bootloader.
107 *
108 * :[-1, 0, 1, 2, 3, 4, 5, 6, 7]
109 */
110 #define SERIAL_PORT 1

`#define SENSORLESS_HOMING //Turn on drive stall detection as a function of the Home limit switch.`

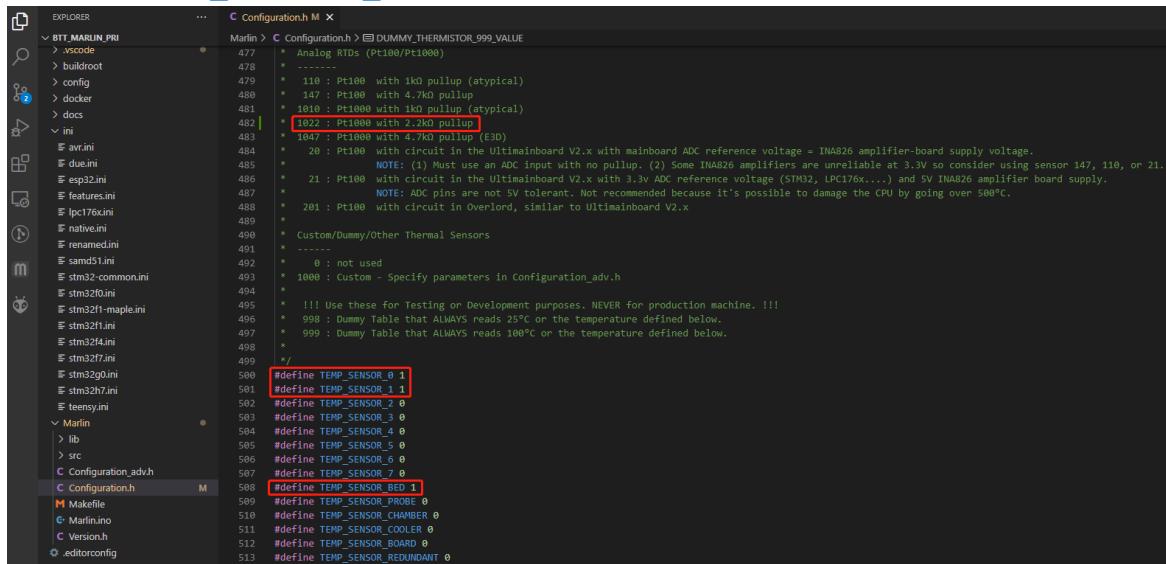

`#define xx_STALL_SENSITIVITY 8 // Set the sensitivity of stall detection. The range of TMC2209 is 0~255. The larger the value, the more sensitive it is, and it is easy to trigger falsely. When the phenomenon is Home, the axis stops before returning to the origin. The smaller the value, the less sensitive it is, and the easier it is not to trigger. Make a "Deng Deng Deng" sound. Other driving ranges are 63~64, the smaller the value, the more sensitive. #define IMPROVE_HOMEING_RELIABILITY // Set the current parameter above(X_CURRENT_HOME) when returning to zero separately , so as to get the best zeroing effect`

```
#define IMPROVE_HOMING_RELIABILITY // The current parameter
(xx_CURRENT_HOME) during zeroing can be set separately above to get the
best zeroing effect
```

### 4.3.6 100K NTC or PT1000

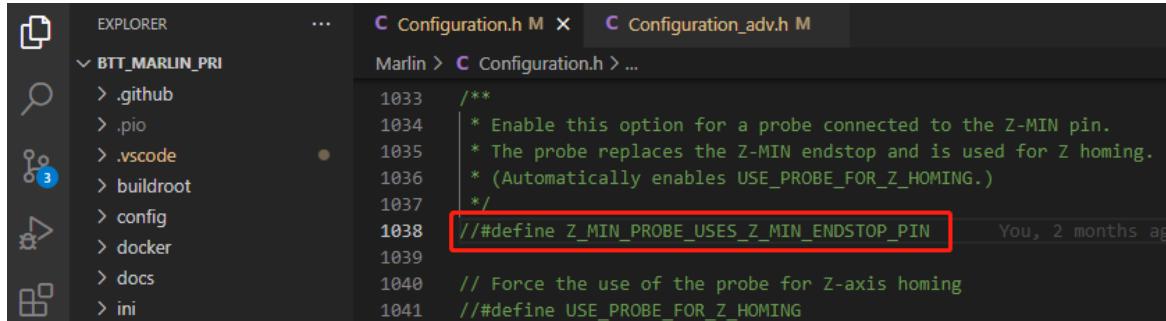

Set the pull-up resistor of the thermistor to 4.7K (with 100K NTC) or 2.2K (with PT1000) through the jumper cap, 1 in Marlin firmware means 100K NTC + 4.7K pull-up resistor, 1022 means PT1000 + 2.2K pull-up Resistance (**Note:** The temperature accuracy read in this way will be much worse than the MAX31865).

```
#define TEMP_SENSOR_0 1
#define TEMP_SENSOR_1 1
#define TEMP_SENSOR_BED 1
```

```
EXPLORER          C Configuration.h M X
Marlin > C Configuration.h > DUMMY_THERMISTOR_999_VALUE
    477 // Analog RTDs (Pt100/Pt1000)
    478 * 110 : Pt100 with 3k pullup (atypical)
    479 * 147 : Pt100 with 4.7k pullup
    480 * 1918 : Pt100 with 1k pullup (atypical)
    481 * 1022 : Pt1000 with 2.2k pullup
    482 * 1847 : Pt1000 with 4.7k pullup (E3D)
    483 * 20 : Pt100 with circuit in the Ultimainboard V2.x with mainboard ADC reference voltage = INA826 amplifier-board supply voltage.
    484 * NOTE: (1) Must use an ADC input with no pullup. (2) Some INA826 amplifiers are unreliable at 3.3V so consider using sensor 147, 110, or 21.
    485 * 21 : Pt100 with circuit in the Ultimainboard V2.x with 3.3V ADC reference voltage (STM32, LPC176x...) and 5V INA826 amplifier board supply.
    486 * NOTE: ADC pins are not 5V tolerant. Not recommended because it's possible to damage the CPU by going over 500°C.
    487 * 201 : Pt100 with circuit in Overlord, similar to Ultimainboard V2.x
    488 * 2011 : Pt100 with 2.2k pullup (E3D)
    489 * 2047 : Pt1000 with 4.7k pullup (E3D)
    490 * 20 : Pt100 with circuit in the Ultimainboard V2.x with mainboard ADC reference voltage = INA826 amplifier-board supply voltage.
    491 * NOTE: (1) Must use an ADC input with no pullup. (2) Some INA826 amplifiers are unreliable at 3.3V so consider using sensor 147, 110, or 21.
    492 * 21 : Pt100 with circuit in the Ultimainboard V2.x with 3.3V ADC reference voltage (STM32, LPC176x...) and 5V INA826 amplifier board supply.
    493 * NOTE: ADC pins are not 5V tolerant. Not recommended because it's possible to damage the CPU by going over 500°C.
    494 * 1000 : Custom - Specify parameters in Configuration_adv.h
    495 * !!! Use these for Testing or Development purposes. NEVER for production machine. !!!
    496 * 998 : Dummy Table that ALWAYS reads 25°C or the temperature defined below.
    497 * 999 : Dummy Table that ALWAYS reads 100°C or the temperature defined below.

## 4.3.9 Resume Printing

There are currently two ways to realize the resume printing:

1.No external module is required, the firmware regularly saves the printing status to the SD card, and continues to print from the point saved in the SD card after a power failure and restart. The disadvantage of this method is that data is frequently written to the SD card, which greatly affects the SD card lifespan.

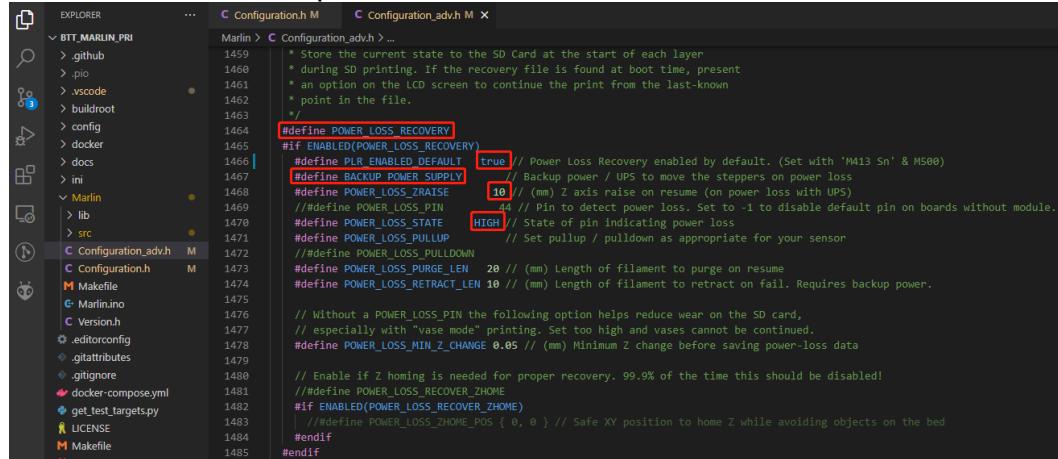

```

```

#define LED\_CONTROL\_MENU // Add a menu to control the LED color on the screen

### 4.3.11 Filament Break Detection

Ordinary material break detection module is generally designed by a mechanical switch, the module gives the motherboard a constant high and low level to represent the state of filaments.

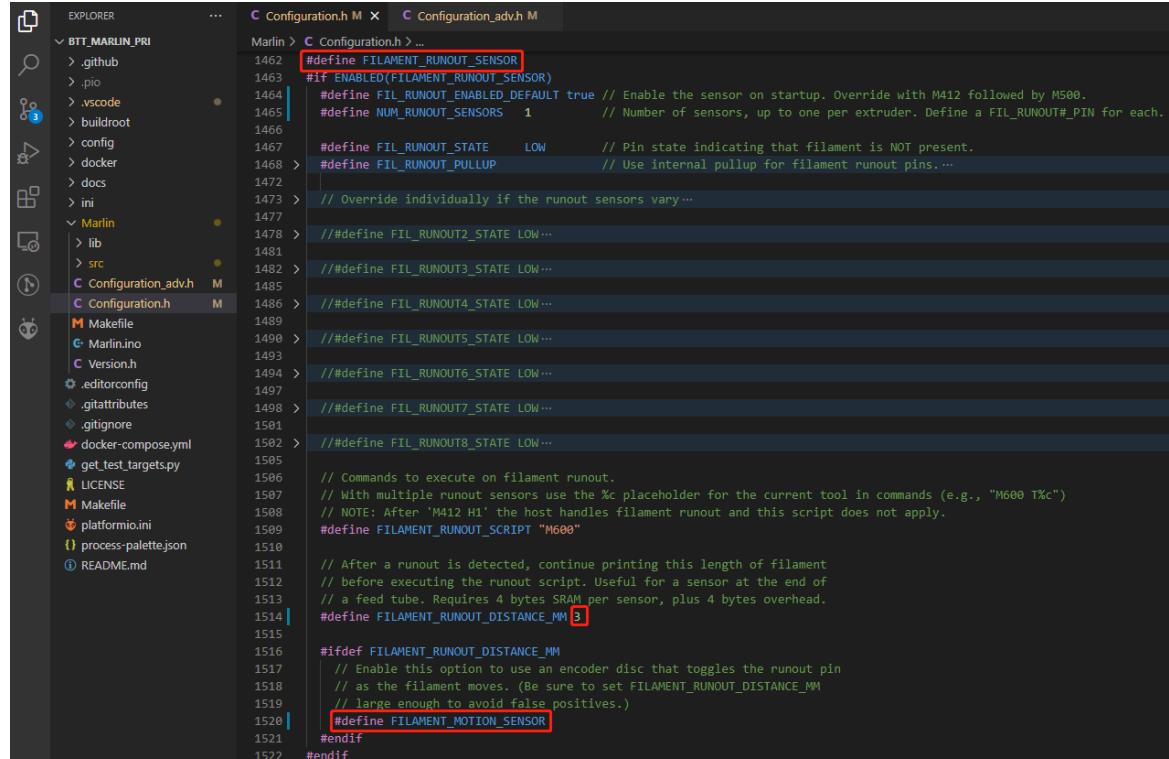

```
EXPLORER    ...    C Configuration.h M    C Configuration_adv.h M
Marlin > C Configuration.h > ...
1462 #define FILAMENT_RUNOUT_SENSOR
1463 #if ENABLED(FILAMENT_RUNOUT_SENSOR)
1464   #define FIL_RUNOUT_ENABLED_DEFAULT true // Enable the sensor on startup. Override with M412 followed by M500.
1465   #define NUM_RUNOUT_SENSORS 1 // Number of sensors, up to one per extruder. Define a FIL_RUNOUT#_PIN for each.
1466
1467   #define FIL_RUNOUT_STATE LOW // Pin state indicating that filament is NOT present.
1468   #define FIL_RUNOUT_PULLUP // Use internal pullup for filament runout pins.
1469   // #define FIL_RUNOUT_PULLDOWN // Use internal pulldown for filament runout pins.
1470   // #define WATCH_ALL_RUNOUT_SENSORS // Execute runout script on any triggering sensor, not only for the active extruder.
1471   // This is automatically enabled for MIXING_EXTRUDERS.
```

#define FILAMENT\_RUNOUT\_SENSOR // Enable filament detection function  
#define FIL\_RUNOUT\_ENABLED\_DEFAULT true // true is on by default  
#define NUM\_RUNOUT\_SENSORS 1 // Quantity of filaments detection sensors  
#define FIL\_RUNOUT\_STATE LOW // The level state when the filaments are

abnormal, set up according to the actual situation of the module. If the module sends a low level when the consumables are abnormal, set it to LOW.

### 4.3.12 Smart Filament Sensor(SFS V1.0)

The Smart Filament Sensor will continuously send a jumping level signal when the filaments pass normally. When abnormal conditions such as material blockage/disconnection occur, the filaments cannot pass through the SFS normally, and the module cannot send a jumping signal to the mainboard, which thus knows that the filaments are abnormal.

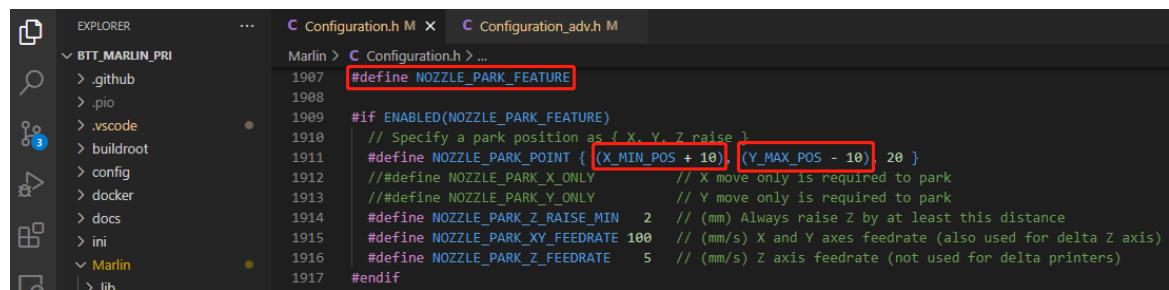

```

#define FILAMENT_RUNOUT_SENSOR
#if ENABLED(FILAMENT_RUNOUT_SENSOR)
#define FILAMENT_RUNOUT_ENABLED_DEFAULT true // Enable the sensor on startup. Override with M412 followed by M500.
#define NUM_RUNOUT_SENSORS 1 // Number of sensors, up to one per extruder. Define a FIL_RUNOUT#_PIN for each.
#define FIL_RUNOUT_STATE LOW // Pin state indicating that filament is NOT present.
#define FIL_RUNOUT_PULLUP // Use internal pullup for filament runout pins...
// Override individually if the runout sensors vary ...
#define FIL_RUNOUT2_STATE LOW...
#define FIL_RUNOUT3_STATE LOW...
#define FIL_RUNOUT4_STATE LOW...
#define FIL_RUNOUT5_STATE LOW...
#define FIL_RUNOUT6_STATE LOW...
#define FIL_RUNOUT7_STATE LOW...
#define FIL_RUNOUT8_STATE LOW...
// Commands to execute on filament runout.
// With multiple runout sensors use the %c placeholder for the current tool in commands (e.g., "M600 T%c")
// NOTE: After 'M412 H' the host handles filament runout and this script does not apply.
#define FILAMENT_RUNOUT_SCRIPT "M600"
// After a runout is detected, continue printing this length of filament
// before executing the runout script. Useful for a sensor at the end of
// a feed tube. Requires 4 bytes SRAM per sensor, plus 4 bytes overhead.
#define FILAMENT_RUNOUT_DISTANCE_MM 7
#endif FILAMENT_RUNOUT_DISTANCE_MM
// Enable this option to use an encoder disc that toggles the runout pin
// as the filament moves. (Be sure to set FILAMENT_RUNOUT_DISTANCE_MM
// large enough to avoid false positives.)
#define FILAMENT_MOTION_SENSOR
#endif

```

#define FILAMENT\_MOTION\_SENSOR // Set filament sensor to encoder type  
#define FILAMENT\_RUNOUT\_DISTANCE\_MM 7 // Set up the detection sensitivity. The recommended setting for SFS V1.0 is 7mm. If there is no level jump within 7mm of the filaments, it means that the filaments are abnormal.

Filaments detection also needs to set up the action after the abnormal suspension of the filaments through the following two places.

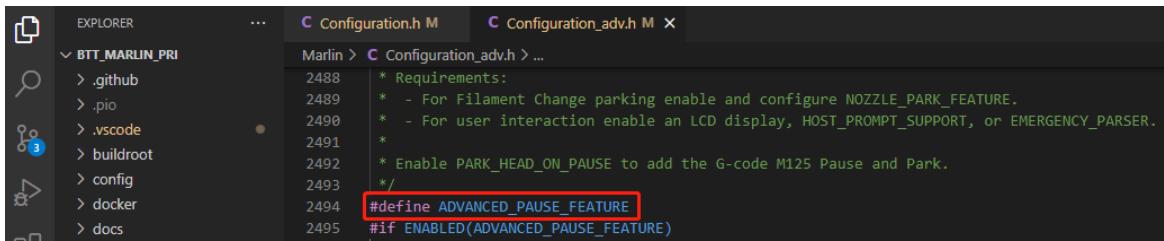

```

#define NOZZLE_PARK_FEATURE
#if ENABLED(NOZZLE_PARK_FEATURE)
// Specify a park position as { X, Y, Z raise }
#define NOZZLE_PARK_POINT { (X_MIN_POS + 10), (Y_MAX_POS - 10), 20 }
//#define NOZZLE_PARK_X_ONLY // X move only is required to park
//#define NOZZLE_PARK_Y_ONLY // Y move only is required to park
#define NOZZLE_PARK_Z_RAISE_MIN 2 // (mm) Always raise Z by at least this distance
#define NOZZLE_PARK_XY_FEEDRATE 100 // (mm/s) X and Y axes feedrate (also used for delta Z axis)
#define NOZZLE_PARK_Z_FEEDRATE 5 // (mm/s) Z axis feedrate (not used for delta printers)
#endif

```

#define NOZZLE\_PARK\_FEATURE // Nozzle Pause Function  
#define NOZZLE\_PARK\_POINT { (X\_MIN\_POS + 10), (Y\_MAX\_POS - 10), 20 }  
//Set the X, Y coordinates and the height of the Z axis when the nozzle is paused

# BIGTREETECH

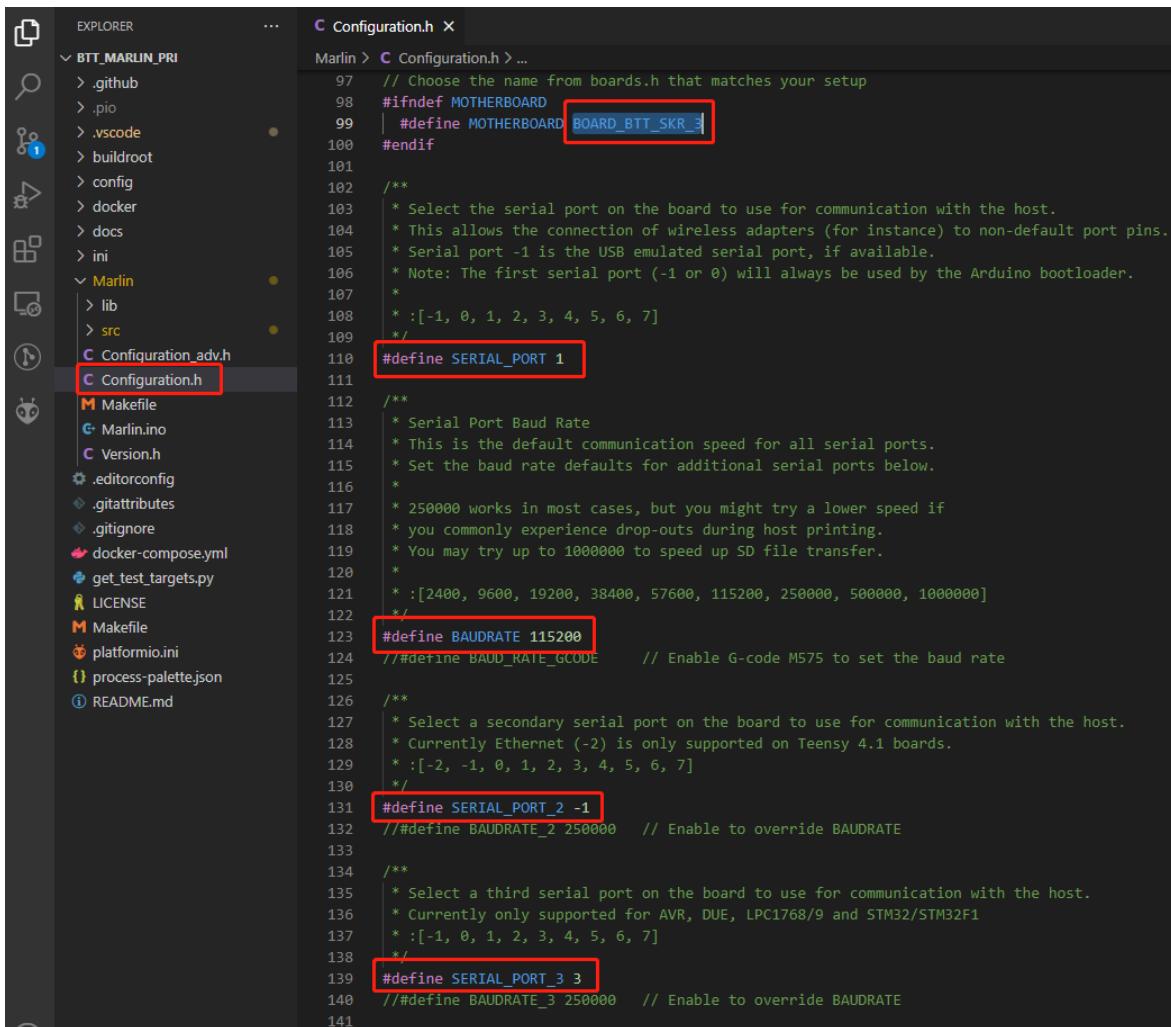

```
EXPLORER C Configuration.h M C Configuration_adv.h M X
Marlin > C Configuration_adv.h > ...
2488 * Requirements:
2489 * - For Filament Change parking enable and configure NOZZLE_PARK_FEATURE.
2490 * - For user interaction enable an LCD display, HOST_PROMPT_SUPPORT, or EMERGENCY_PARSER.
2491 *
2492 * Enable PARK_HEAD_ON_PAUSE to add the G-code M125 Pause and Park.
2493 */
2494 #define ADVANCED_PAUSE_FEATURE
2495 #if ENABLED(ADVANCED_PAUSE_FEATURE)
```

#define ADVANCED\_PAUSE\_FEATURE // You can set parameters such as the length and speed of filament retraction during pause, and the length and speed of filament extrusion after continuing to print.

## 4.3.13 ESP3D

Just set the correct "SERIAL\_PORT" and "BAUDRATE" in Marlin. The serial port for communication between ESP8266 and Marlin on the motherboard is UART3, so set SERIAL\_PORT to 3.

```
EXPLORER C Configuration.h X
Marlin > C Configuration.h > ...
97 // Choose the name from boards.h that matches your setup
98 #ifndef MOTHERBOARD
99 | #define MOTHERBOARD BOARD_BTT_SKR_3
100 #endif
101 /**
102 * Select the serial port on the board to use for communication with the host.
103 * This allows the connection of wireless adapters (for instance) to non-default port pins.
104 * Serial port -1 is the USB emulated serial port, if available.
105 * Note: The first serial port (-1 or 0) will always be used by the Arduino bootloader.
106 *
107 * :[-1, 0, 1, 2, 3, 4, 5, 6, 7]
108 */
109 #define SERIAL_PORT 1
110 /**
111 * Serial Port Baud Rate
112 * This is the default communication speed for all serial ports.
113 * Set the baud rate defaults for additional serial ports below.
114 *
115 * 250000 works in most cases, but you might try a lower speed if
116 * you commonly experience drop-outs during host printing.
117 * You may try up to 1000000 to speed up SD file transfer.
118 *
119 * :[2400, 9600, 19200, 38400, 57600, 115200, 250000, 500000, 1000000]
120 */
121 #define BAUDRATE 115200
122 // #define BAUD_RATE_GCODE // Enable G-code M575 to set the baud rate
123 /**
124 * Select a secondary serial port on the board to use for communication with the host.
125 * Currently Ethernet (-2) is only supported on Teensy 4.1 boards.
126 * :[-2, -1, 0, 1, 2, 3, 4, 5, 6, 7]
127 */
128 #define SERIAL_PORT_2 -1
129 // #define BAUDRATE_2 250000 // Enable to override BAUDRATE
130 /**
131 * Select a third serial port on the board to use for communication with the host.
132 * Currently only supported for AVR, DUE, LPC1768/9 and STM32/STM32F1
133 * :[-1, 0, 1, 2, 3, 4, 5, 6, 7]
134 */
135 #define SERIAL_PORT_3 3
136 // #define BAUDRATE_3 250000 // Enable to override BAUDRATE
137
138
139
140
141
```

You can get the latest ESP3D firmware at <https://github.com/luc-github/ESP3D>, compile your own binary, rename it to "esp3d.bin" and copy it to the root directory of the SD card, plug it into the motherboard and then Reset, the bootloader in the motherboard will automatically update the esp3d.bin to the ESP8266, and the file will be renamed to "ESP3D.CUR" after the update is completed.

## 4.4 Compile the Firmware

1. Click "√" in the status bar at the bottom to compile the firmware.

2. After the compilation is completed, the "firmware.bin" file will be generated, copy it to the SD card to update the firmware.

```

## 5. Klipper

### 5.1 Preparation

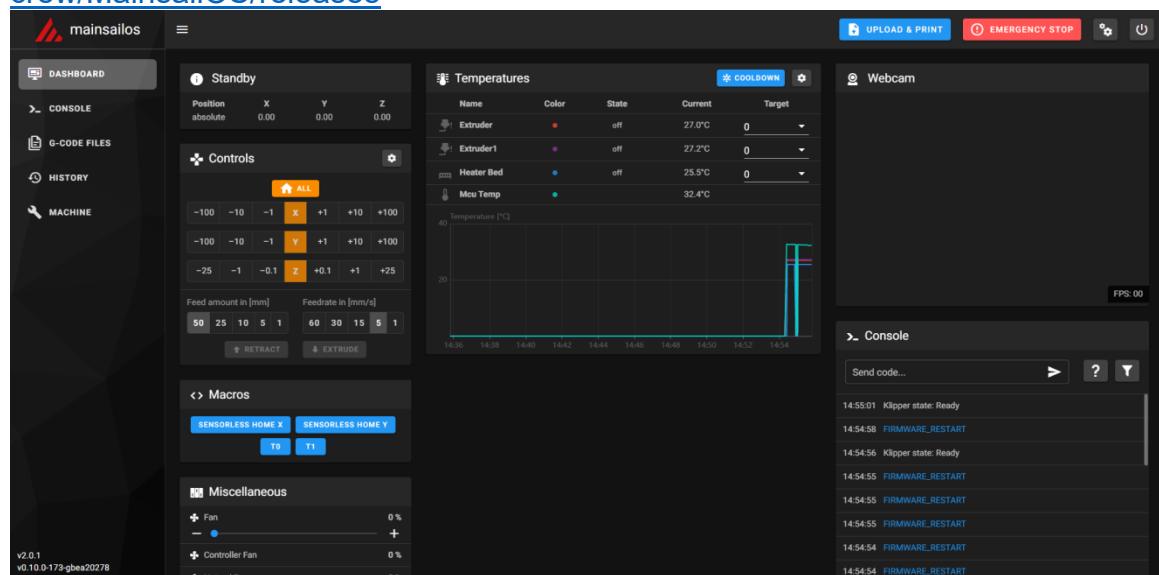

#### 5.1.1 Download System Image

Download the system image with your favorite WebUI built-in, currently, the mainstream ones are Fludd, Mainsail, etc.

The System of Built-in Fludd:<https://github.com/fludd-core/FluddPI/releases>

The System of Built-in Mainsail:<https://github.com/mainsail-crew/MainsailOS/releases>

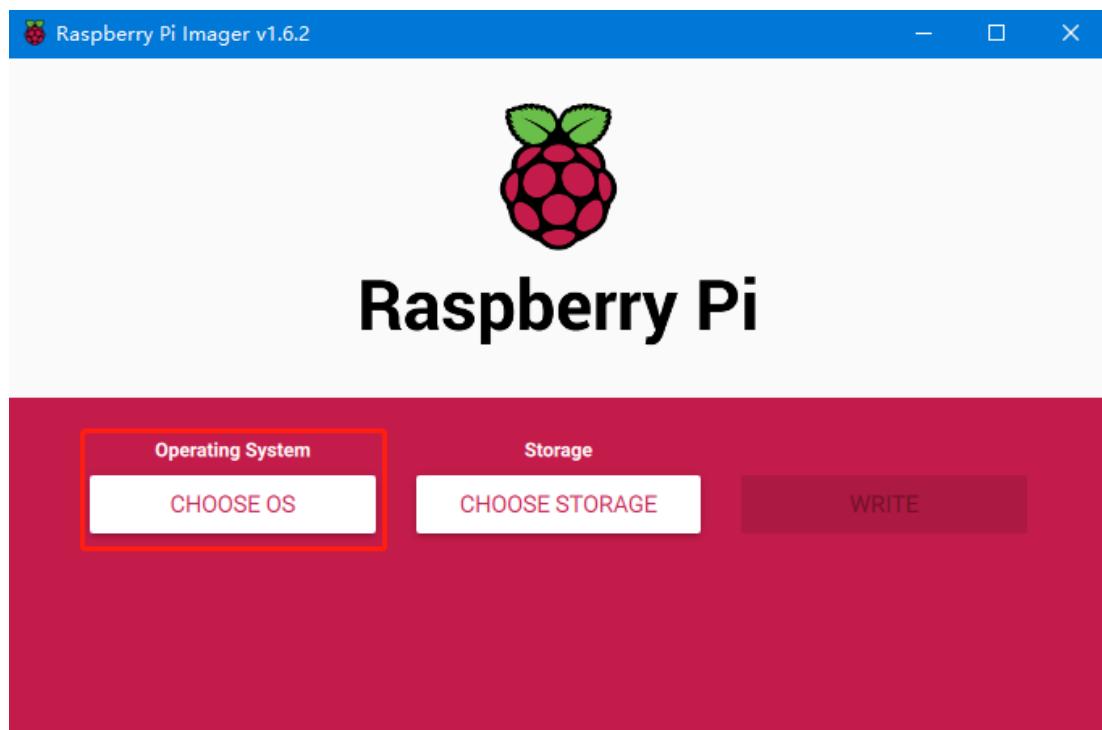

or refer to [Klipper official installation instructions](#) Use Octoprint

### 5.1.2 Download and Install Raspberry Pi Imager

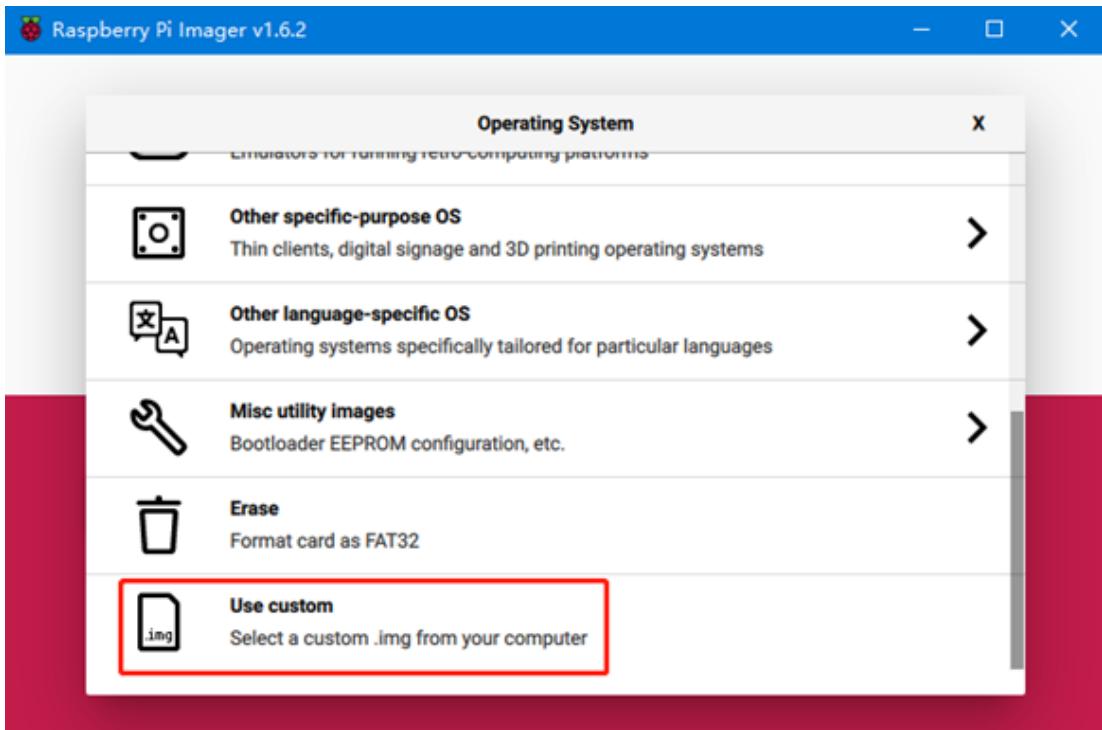

Download and install the official burning software for Raspberry Pi:  
<https://www.raspberrypi.com/software/>

### 5.2 Burn Image

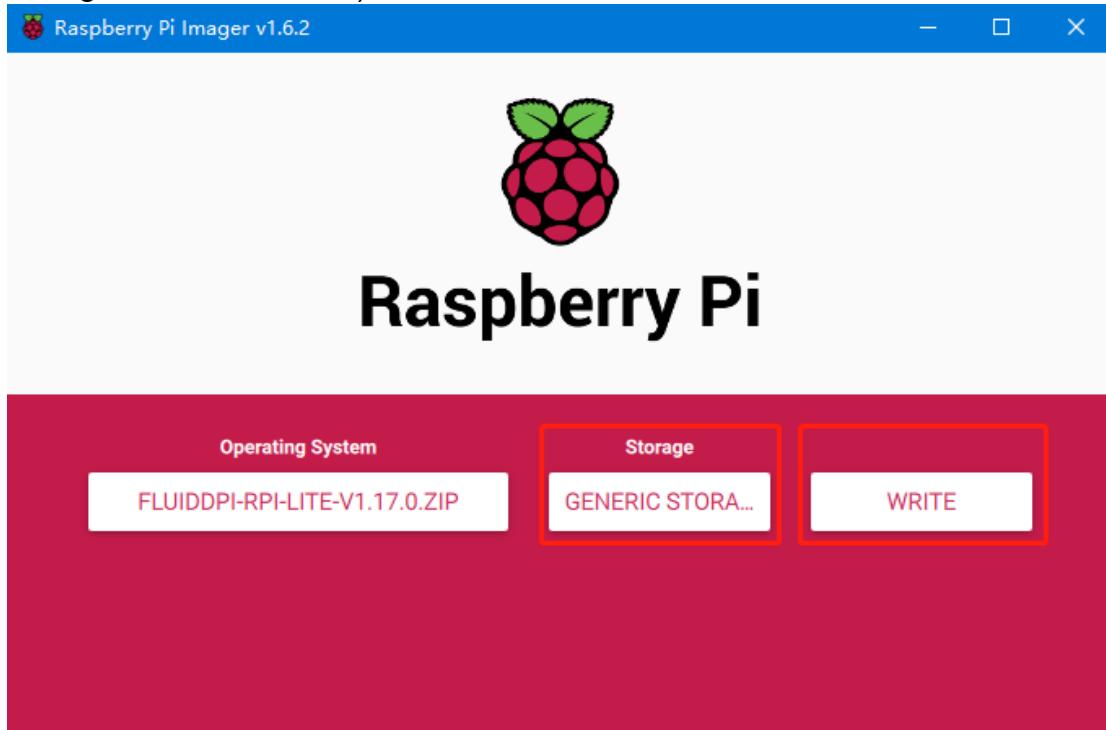

1. Insert the Micro SD card into the computer through the card reader.
2. Select System.

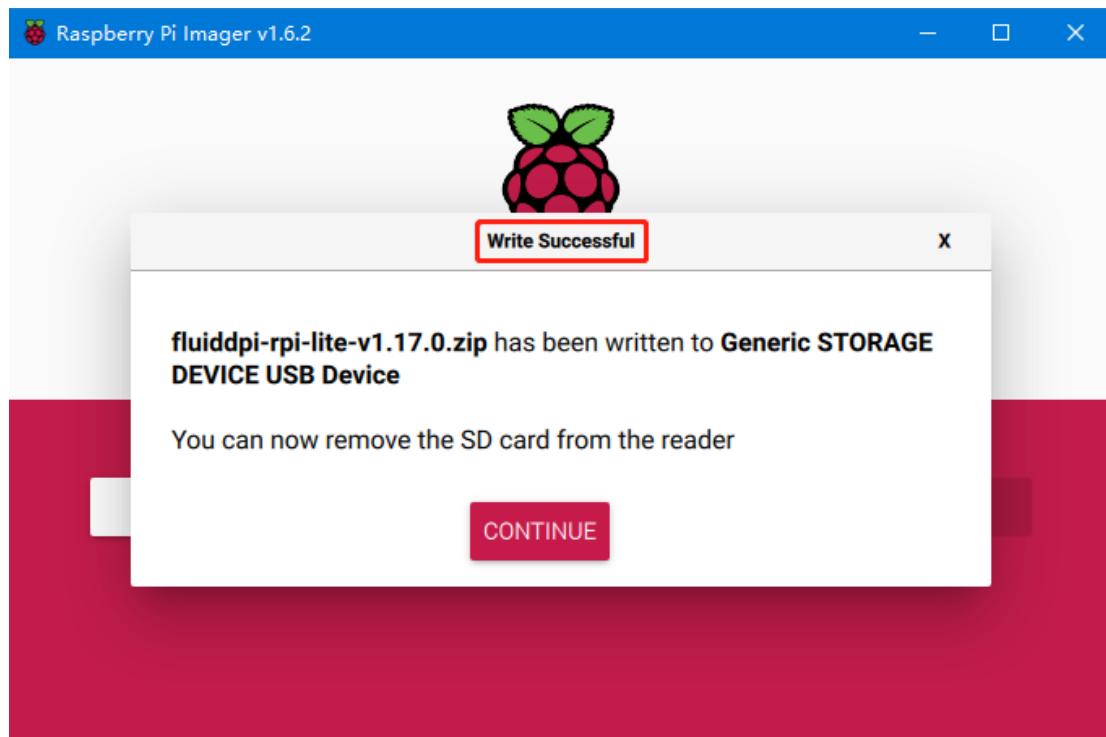

3. Select User Defined, and then select the image downloaded to your computer.

4. Select the SD card to be burned (burning the image will format the SD card, be careful not to select the wrong drive letter, otherwise the data on other storage will be formatted), and click "burn".

5. Wait for the burn to complete.

## 5.3 Set up WIFI

Note: You can skip this step if using a cable port instead of WIFI

1. Re-plug the card reader
2. Find the "fluiddpi-wpa-supplicant.txt" or "mainsail-wpa-supplicant.txt" file in the boot disk of the SD card and open it with VSCode (do not open it with the Notepad that comes with Windows)

A screenshot of a file explorer window showing the contents of a folder named "boot (J:)". The folder contains several files: config.txt, fluiddpi-wpa-supplicant.txt, ssh, and issue.txt. The file "fluiddpi-wpa-supplicant.txt" is highlighted with a red box. The table below provides a detailed view of these files:

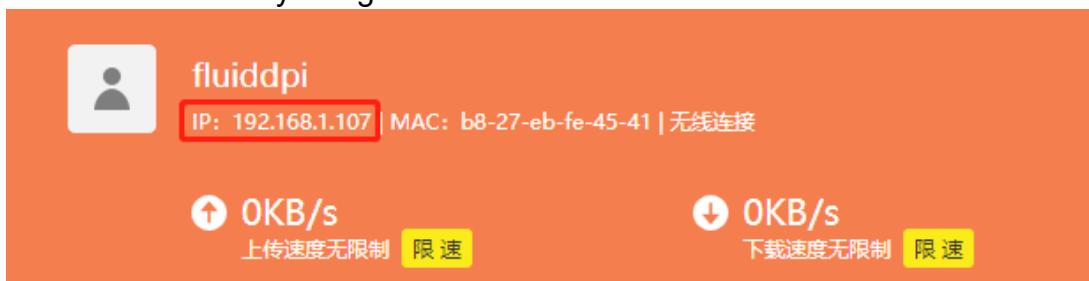

名称	修改日期	类型	大小
config.txt	2022/2/25 20:55	文本文档	3 KB
fluiddpi-wpa-supplicant.txt	2022/2/25 20:55	文本文档	2 KB
ssh	2022/2/25 20:54	文件	0 KB
issue.txt	2022/1/28 1:22	文本文档	1 KB

3. Delete the '#' character at the beginning of the four lines in the red box, then set the correct WIFI name and password and save it

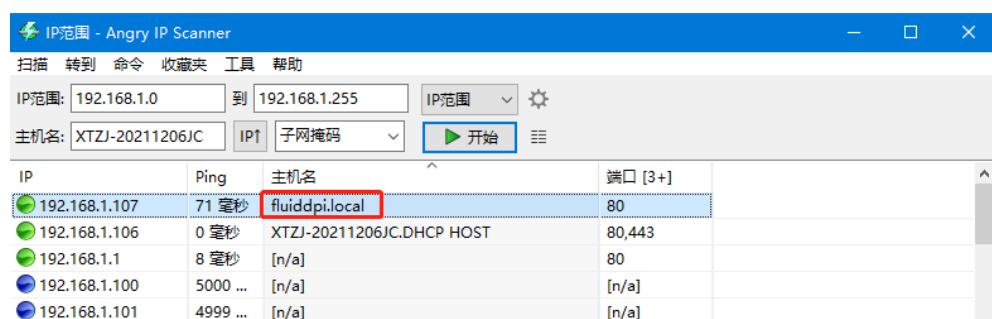

```
J: > fliddpi-wpa-supplicant.txt
26 ## WPA/WPA2 secured
27 network={
28     ssid="put SSID here"
29     psk="put password here"
30 }
```

## 5.4 Connection of ssh software with Raspberry Pi

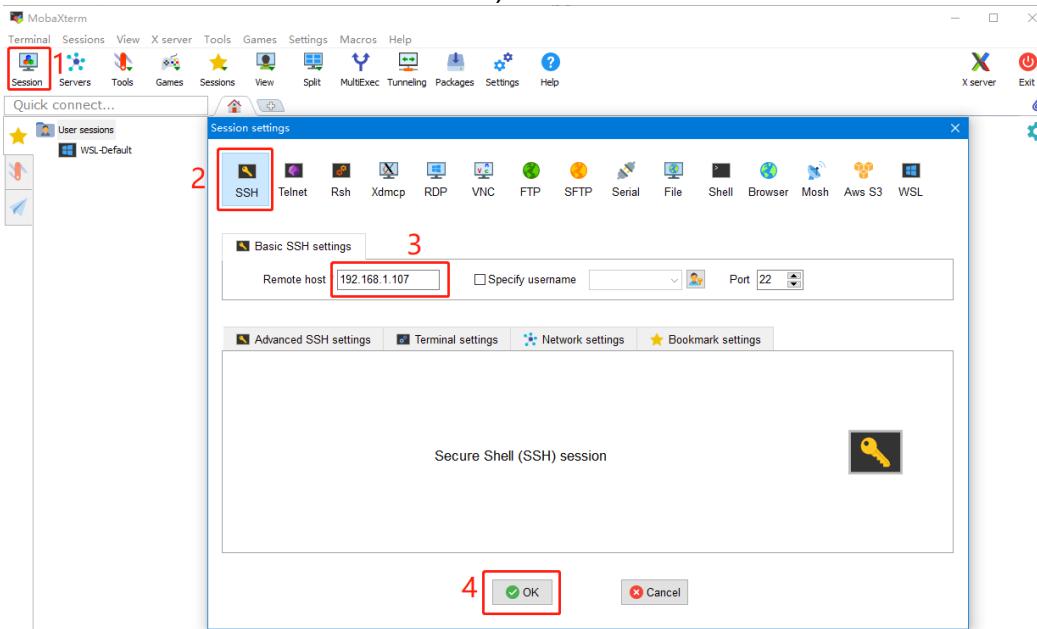

1. Install the ssh software Mobaxterm:<https://mobaxterm.mobatek.net/download-home-edition.html>
2. Insert the SD card into the Raspberry Pi, power on and wait for the system to start, about 1~2 minutes
3. After the Raspberry Pi is connected to WIFI or plugged in the Internet cable, it will be automatically assigned an IP
4. After the Raspberry Pi is connected to WIFI or plugged in the Internet cable, it will be automatically assigned an IP

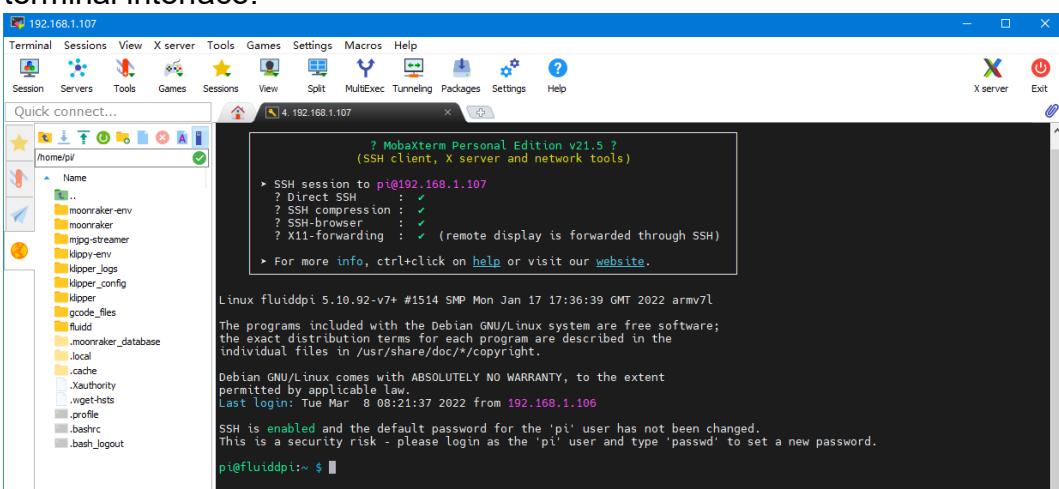

5. Or use [the https://angryip.org/](https://angryip.org/) tool to scan all IP addresses under the current local area network, and use the hostname to reorder to find the device with the hostname Flidd or Mainsail, as shown in the following figure.

6. Open the installed Mobaxterm software, click "Session", click "SSH" in the pop-up window, enter the IP address of the Raspberry Pi in the Remote host column, and click "OK" (Note: the computer and the Raspberry Pi must be under the same local area network).

7. Enter the login name login as: pi, login password: raspberry, to enter the SSH terminal interface.

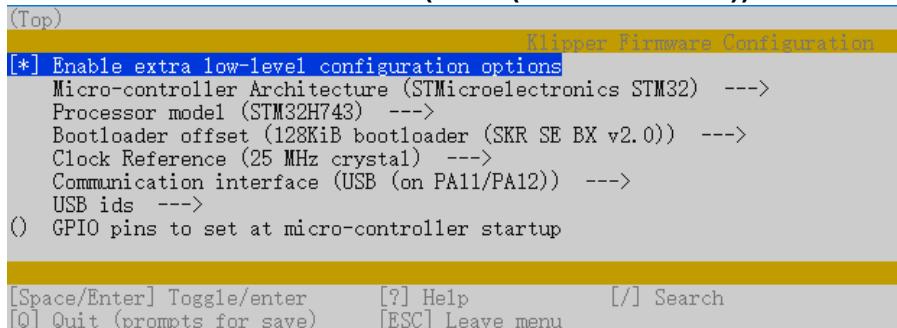

## 5.5 Compile the Firmware

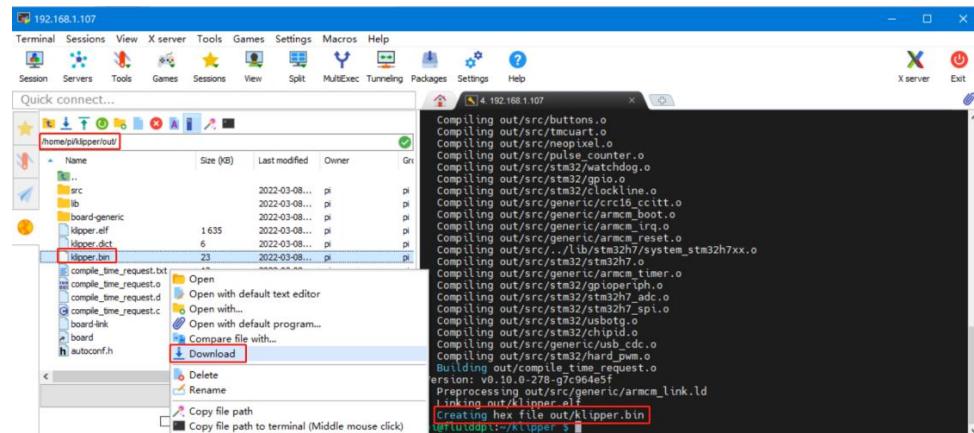

1. After connecting to the Raspberry Pi via ssh, enter at the command line:  
**cd ~/klipper/  
make menuconfig**  
 Compile the firmware with the following configuration (if the following options are not available, please update the Klipper firmware source to the latest)

version).

- \* [\*] **Enable extra low-level configuration options**
- \* **Micro-controller Architecture (STMicroelectronics STM32) --->**
- \* **Processor model (STM32H743) --->**
- \* **Bootloader offset (128KiB bootloader (SKR SE BX v2.0)) --->**
- \* **Clock Reference (25 MHz crystal) --->**
- \* **Communication interface (USB (on PA11/PA12)) --->**

2. After the configuration selection is completed, enter 'q' to exit the configuration interface, when asked whether to save the configuration, select "Yes"
3. Enter make to compile the firmware. When make is completed, the `klipper.bin` firmware we need will be generated in the home/pi/klipper/out folder of the Raspberry Pi, which can be downloaded directly to the computer on the left side of the ssh software.

4. Rename klipper.bin to "firmware.bin" and copy it to the SD card to update the firmware
5. Enter at the command line: **ls /dev/serial/by-id/** to query the ID of the motherboard to confirm whether the firmware is successfully burned. If the burning is successful, it will return a klipper device ID, as shown in the following figure

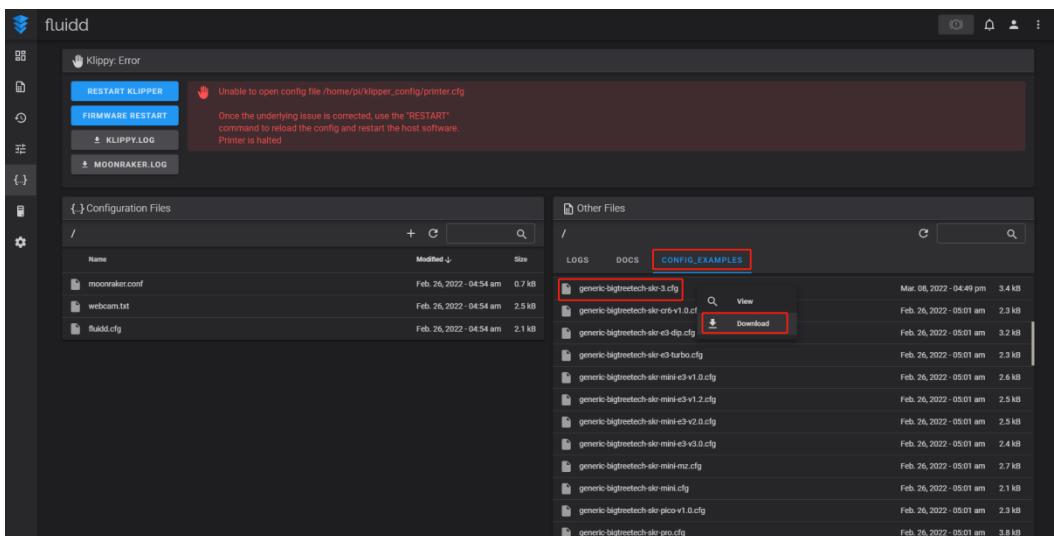

# BIGTREETECH

```
pi@fluiddipi:~/klipper $ ls /dev/serial/by-id/  
usb-Klipper_stm32h743xx_41003D001751303232383230-if00  
pi@fluiddipi:~/klipper $
```

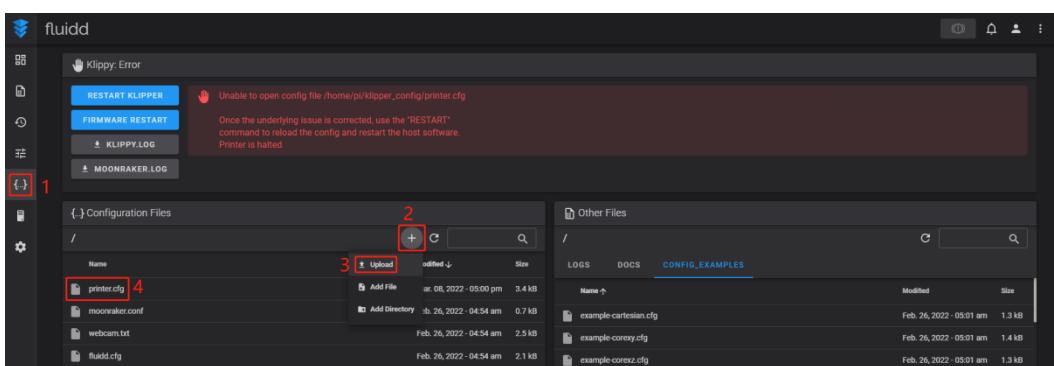

Copy and save this ID, this ID needs to be set in the configuration file.

## 5.6 Configure Klipper

- 1.Enter the IP address of the Raspberry Pi in the computer's browser, and download the reference configuration of the motherboard from the path shown in the figure below. If you cannot find this file, please update the Klipper firmware source code to the latest version, or download it from GitHub  
<https://github.com/bigtreetech/SKR-3>

- 2.Upload the motherboard configuration file to Configuration Files and rename it to "printer.cfg".

- 3.Modify the ID number in the configuration file to the actual ID of the motherboard

```
x printer.cfg
81
82 [mcu]
83 serial: /dev/serial/by-id/usb-Klipper_stm32h743xx_41003D001751303232383230-if00
84
```

4. Follow the instructions at <https://www.klipper3d.org/Overview.html> to configure the specific features of the machine.

## 6. Firmware Update

### Micro SD card update

1. Make sure the Micro SD card has been formatted as FAT32 file system.
2. Rename the firmware compiled by yourself or downloaded from GitHub to "firmware.bin" (note: clarify the extension settings of the computer system, some users hide the extension, "firmware.bin" actually shows "firmware" )
3. Copy "firmware.bin" to the root directory of the Micro SD card.
4. Insert the Micro SD card into the card slot of the motherboard, power on the motherboard again, and the motherboard's bootloader will automatically update the firmware.
5. During the firmware update process, the status indicator on the upper right corner of the motherboard will start to flash.
6. When the status indicator stops flashing and the file name in the Micro SD card is renamed to "FIRMWARE.CUR", it means the firmware update is successful.

## 7. Cautions

1. When the PT1000 is not used, the jumper cap cannot be inserted on it, otherwise the 100K NTC cannot be used normally.
2. The current of the hotbed connected to the mainboard must be less than or equal to 10A. If you want to use a high-power hotbed, it is recommended to choose a hotbed powered by 24V, and use 24V to power the mainboard.
3. Pay attention to the power supply selection of the NC fan, the jump cap must be set, so that the fan can work normally.

4. Pay attention to the setting of the USB port switch. When there is no response when plugged into the computer, make sure that the double-pole double-throw switch is in the USB mode of the pop-up state.
5. The mainboard adopts a non-elastic card slot, and the stroke is much less than that of the self-elastic card slot. When the user inserts the card, the action must be light and slow. Do not insert the card vigorously, and the damage caused will not be accepted by our company.

## 8. FAQ

**Q: The maximum current of the hotbed, heating rod, and fan ports:**

A: The maximum output current of the heated bed port: 10A, the peak value is 11A.

Heating rod port maximum output current: 5.5A, peak 6A.

The maximum output current of fan interface: 1A, peak 1.5A.

The total current of the heating rod + driver + fan needs to be less than 10A.

**Q: SD card cannot update firmware:**

A: Make sure that the SD card has been formatted as a FAT32 file system, and make sure the firmware name is "firmware.bin". Some users' computers have set "Hide known extensions", and "firmware.bin" is displayed. The file The name is actually "firmware.bin.bin".
